## PREFACE

This volume represents the second to appear in the series of Tables of Data prepared by the present author. It presents in organized and conveniently usable form a summary of data on a selected list of organic compounds containing carbon and chlorine, or carbon, oxygen, and chlorine, or carbon, hydrogen, and chlorine, or carbon, hydrogen, oxygen, and chlorine. Such compounds may more briefly be described as comprising Order 3.

Although users of its predecessor will immediately recognize many aspects of similarity in this book, they will also note in this volume certain differences. These distinctions are more fully discussed in Chapter I, but certain general aspects may be noted here.

Whereas the treatment of Order 1 compounds was directed mainly toward the aspect of identification, and though this point of view is vigorously continued, the present treatment of compounds of Order 3 has been expanded to include also the preparation, properties, and general chemical behavior of the individuals selected for treatment.

A second major difference from the earlier volume is in the extent of reference to the original literature or the corresponding abstracts thereof. This documentation is carried to a degree which may suggest to organic chemists that this volume comprises a Beilstein. The author hastens to disclaim any such degree of completeness for this work but does admit that for each compound selected a meticulous search of the literature through 1945 has furnished the basis for appropriate selection and systematic grouping of the aspects to be treated.

A third important difference from the earlier volume is the inclusion of references to patents as well as scientific articles. Though such patent references are treated with reserve, it is believed that they will be of interest to all users and of special value to industrial chemists. Throughout the book emphasis is given to industrial aspects since the rapid growth of this field during the last two decades, particularly in the United States, has resulted in the production and large-scale utilization of many individual compounds of this order (3).

A fourth type of difference in the present treatment as compared with that of Order 1 is seen in the tabulation of physical constants. In the earlier volume an attempt was made to select the "best" values. This process tended to conceal the magnitude and nature of the available constants from

## CHAPTER I

Introduction .. . . .	1-19
-----------------------	------

## DATA ON INDIVIDUAL COMPOUNDS

### *Division A. Solids*

CHAPTER II	PAGES	CHAPTER VII	PAGES
Serial numbers 3:0000-3:0499	20-84	Serial numbers 3:2500-3:2999	277-299
 CHAPTER III		 CHAPTER VIII	
Serial numbers 3:0500-3:0999	85-125	Serial numbers 3:3000-3:3499	300-334
 CHAPTER IV		 CHAPTER IX	
Serial numbers 3:1000-3:1499	126-205	Serial numbers 3:3500-3:3999	335-359
 CHAPTER V		 CHAPTER X	
Serial numbers 3:1500-3:1999	206-252	Serial numbers 3:4000-3:4499	360-409
 CHAPTER VI		 CHAPTER XI	
Serial numbers 3:2000-3:2499	253-276	Serial numbers 3:4500-3:4999	410-506

### *Division B. Liquids with boiling points reported at ordinary pressure*

†

	CHAPTER XII	PAGES
Section 1. $D_4^{20}$ greater than 1.1500;	Serial numbers 3:5000-3:5499	507-700

### CHAPTER XIII

Section 1. $D_4^{20}$ greater than 1.1500;	Serial numbers 3:5500-3:5999	701-789
--	------------------------------	---------

## CHAPTER XIV

Section 1.	$D_4^{20}$	greater than 1.1500; Serial numbers	3:6000-3:6499	790-875
------------	------------	-------------------------------------	---------------	---------

## CHAPTER XV

Section 1.	$D_4^{20}$	greater than 1.1500; Serial numbers	3:6500-3:6999	876-929
------------	------------	-------------------------------------	---------------	---------

## CHAPTER XVI

Section 2.	$D_4^{20}$	less than 1.1500; Serial numbers	3:7000-3:7499	930-1044
------------	------------	----------------------------------	---------------	----------

## CHAPTER XVII

Section 2.	$D_4^{20}$	less than 1.1500; Serial numbers	3:7500-3:7999	1045-1095
------------	------------	----------------------------------	---------------	-----------

## CHAPTER XVIII

Section 2.	$D_4^{20}$	less than 1.1500; Serial numbers	3:8000-3:8499	1096-1153
------------	------------	----------------------------------	---------------	-----------

## CHAPTER XIX

Section 2.	$D_4^{20}$	less than 1.1500; Serial numbers	3:8500-3:8999	1154-1227
------------	------------	----------------------------------	---------------	-----------

*Division C. Liquids with boiling points reported only under reduced pressure*

## CHAPTER XX

Serial numbers	3:9000-3:9299	1228-1279
----------------	---------------	-----------

## CHAPTER XXI

Serial numbers	3:9300-3:9599	1280-1322
----------------	---------------	-----------

## CHAPTER XXII

Serial numbers	3:9600-3:9999	1323-1358
----------------	---------------	-----------

## CHAPTER XXIII

I.	Index of compounds according to empirical formulas	1359-1379
II.	Index of empirical formulas according to percentage chlorine content	1380-1382
III.	Index of empirical formulas according to molecular weights	1383-1385
IV.	Index of compounds according to chemical types	1386-1422
V.	Index of compounds by names in alphabetical sequence	1423-1443

# ABBREVIATIONS

$[\alpha]_D^{20}$	A specific rotation at 20° for D line	aq. arom. assoc.(d) (n)	water or aqueous aromatic associate(s) (associated) (association)
$\bar{A}$	represents acid residue in whose description it occurs	B	represents a molecule of the "basic" salt- forming compound in whose description it occurs
abs.	absolute; absolutely	B.B.No.	bromide-bromate num- ber
abt.	about	bibl.	bibliography
abund.	abundant	bkn.	"broken" (cf. color ter- minology)
abv.	above	boilg.	boiling
Ac	acetyl radical, i.e., $\text{CH}_3\text{CO}-$	b.p.	boiling point (at atm. pressure unless speci- fied)
AcOEt	ethyl acetate	Bu	n-butyl
AcOH	acetic acid (glacial ace- tic acid when unmodi- fied)	bril.	brilliant
Ac <sub>2</sub> O	acetic anhydride	brn.	brown
ao.	acid	Bz	benzoyl, i.e., $\text{C}_6\text{H}_5\text{CO}-$
aco.	according	BzOH	benzoic acid
acid.	acidify, acidified, acidi- fication	C	Centigrade degrees
act.	active	$\bar{C}$	used to designate the compound in whose description it occurs
addn.(l)	addition (additional)	calc.(d) (n)	calculate(d) (calculation)
adj.	adjacent (e.g., 1,2,3)	cap.	capillary
alc.	alcohol (95% unless otherwise stated); al- coholic	cat.	catalyst; catalytic; catalyzed
ald.	aldehyde	cc.	cubic centimeter(s)
alk.(y)	alkali; alkaline; (alka- linity)	cf.	compare
alm.	almost	cg.	centigram(s)
Am	amyl	charac.	characteristic
ammon.	ammoniacal	chem.	chemical
amorph.	amorphous	cis-	stereochemical opposite of trans-
amt.(s)	amount(s)	cm.	centimeter(s)
anal.	analysis; analyses		
anhyd.	anhydrous		
anti-	anti (stereomeric oppo- site of <i>syn</i> -)		
apprec.	appreciable; appreci- ably		
approx.	approximate; approxi- mately		

coeff.	coefficient	diam.	diameter
col.(n)	color (coloration)	diff.	different; difference; difficultly
comb.(d)(n) (g)	combine(d) (combination) (combining)	dil.(td) (tg) (n)	dilute (diluted) (diluting) (dilution)
comml.	commercial	dimin.	diminish; diminishing; diminished; diminutive
compd.	compound	dis.(lvd)	dissolve (dissolved)
compn.	composition	dissoc.(d) (g) (n)	dissociate(d) (dissociating) (dissociation)
conc.(d) (n)	concentrate(d) (concentration)	dist.(d) (g) (n)	distil(l)ed (distilling) (distillation)
condens.	condensation	distrib.(n)	distribute (distribution)
cond.	condition(s)	div.(n)	divide (division)
confm.(n)	confirm; confirmatory (confirmation)	dk.	dark
const.	constant	d,l-	racemic (by external compensation as contrasted with <i>meso</i> )
cont.(s) (g)	contain(s) (containing)	D.V.	Duclaux Value
conv.(n)	convert (conversion)		E
cor.	corrected		easily
corresp.	corresponding		effervesce(s); effervescent
C.P.	chemically pure		equivalent
cpd.	compound		especially
crit.	critical		estimate(s) (estimated) (estimating) (estimation)
cryst.(n) (d)	crystal(s); crystallize(s) (d); crystalline (crystallization)		Et
C.S.T.	critical solubility temperature		ethyl, i.e., $\text{CH}_3\text{CH}_2$ —
	D		ethyl alcohol (generally refers to 95% if unmodified)
①	derivative (used to introduce important derivatives for specific characterizations)		ether (generally means ordinary diethylether)
(D)	dark (following name of a broken color)	Et	
$D_4^{20}$	density at 20° referred to water at 4°	EtOH	
d-	dextrorotatory	eth.	
dec.(d) (n)	decompose(s) (decomposed) (decomposition)	evap.(d) (g) (n)	evaporate(d) (evaporating) (evaporation)
deliq.	deliquesce(s), deliquescent	evol.(n)	evolve(s) (evolution)
depolym.(d) (n)	depolymerize(s) (depolymerized) (depolymerization)	exam.(d) (n)	examine(d) (examination)
deriv.(s) (d) (n)	derivative(s) (derived) (derivation)	expt.(l)	experiment(al)
desic.	desiccator; desiccated	ext.(d) (g) (n)	extract(s) (extracted) (extracting) (extraction)
detectn.	detection		F
detn.(d)	determine; determination (determined)	fil.(n)	filter(s); filtrate (filtration)
		floc.	flocculate; flocculent
		fluores.	fluoresce(s); fluorescent

f.p.	freezing point	insol.(y)	insoluble (insolubility)
freq.	frequently	irreg.	irregular
fract.(n) (nl)	fraction; fractionate (fractionation) (fractional)	irrit.(n)	irritating (irritation)
		isom.(d) (n)	isomer; isomerize (isomerized) (isomerization)
fum.	fumaroid (stereochemical opposite of maleinoid)		
fumg.	fuming		K
fus.(n)	fuse(s), melt(s); fusible; fusing (fusion)	k	ionization constant
	G	(L)	L
g.	gram(s)		Light (modifying name of a broken color)
gem.	geminate (said of two like groups attached to same atom)	l-	laevorotatory
		l.	liter(s)
geom.	geometrical	lft(s).	leaflet(s)
glac.	glacial	lgr.	ligroin
gr.	green	liq.	liquid; liquefy
grad.	graduate; graduated; gradually	lt.	light (of a color)
gran.	granular; granulated		
		(M)	M
			medium (modifying name of a broken color)
	H	m.	melt(s)
H.E.	hydrolysis equivalent	m-	meta
hexag.	hexagon, hexagonal	mal.	maleinoid (stereochemical opposite of fumaroid)
hr.(s)	hour(s)		
ht.(d) (g)	heat(ed) (heating)	max.	maximum
hydrol.(g) (zd)	hydrolyze; hydrolysis; (hydrolyzing) (hydrolyzed)	Me	methyl, i.e., CH <sub>3</sub> —
		MeOH	methanol, i.e., CH <sub>3</sub> OH
bygros.	bygrosopic	m.e.	milliequivalent
		mg.	milligram(s)
	I	mic.	micro
ibid.	in the same place	microcryst.	microcrystalline
ident.	identical; identity	min.	minute(s); minimum
identif.(d) (n)	identify (identified) (identification)	minl.	mineral
		misc.	miscellaneous; miscible
i.e.	that is	mixt.	mixture(s)
immed.	immediate; immediately	mod.	moderate
impt.	important	modifn.	modification
inact.	inactive; inactivated	mol.	molecular
indef.	indefinite	monoclin.	monoclinic
indic.	indicate; indicator; indicated	ml.	milliliter
		mm.	millimeter
inf.	infinite	m p.	melting point
inorg.	inorganic	ms	meso-

<b>N</b>			
<i>N</i>	normal (equivalents per liter)	pr.	prism(s)
"	normal	pract.	practically
$n_D^{20}$	refractive index at 20° for D line of sodium	prep.(d) (g) (n)	prepare(d) (preparing) (preparation)
ndl.(s)	needle(s)	pres.	presence
neg.	negative	press.	pressure
Neut. Eq.	neutralization equivalent	prim.	primary
neut.(zd)	neutral (neutralized)	prin.	principal
no.	number	prismat.	prismatic
non-fus.	non-fusible	prob.	probably
non-vol.	non-volatile	proc.	procedure
		prod.	product; produce; produced
		prop.	property; properties
		pt.(s)	part(s)
		pulv.(d)	pulverize(d)
		pung.	pungent
		purif.(d) (g) (n)	purify (purified) (purifying) (purification)
<b>O</b>			
o-	ortho		
obs.(d) (n)	observe(d) (observation)		
obt.(d)	obtain(ed)		
opt.	optical		
optim.	optimum	quad.	quadratic
or.	orange	qual.	qualitative; qualitatively
ord.	ordinary		
orig.	original; originally	quant.	quantity; quantitative; quantitatively
org.	organic		
oxid.(g) (n)	oxidize(s) (oxidizing) (oxidation)	quat.	quaternary
		q.v.	quod vide (which see)
<b>P</b>			
Ⓟ	preliminary test		
p-	para	rac.	racemic
perm.	permanent	rap.	rapid; rapidly
pet.	petroleum	reactn.	reaction(s)
Ph	phenyl, i.e., $C_6H_5-$	reagt.(s)	reagent(s)
phys.	physical	rearr.	rearrange(s); rearrangement
physiol.	physiological		
Ek	picryl, i.e., 2,4,6-trinitrophenyl-	recommnd.	recommend; recommended
PkOH	picric acid	recryst.(d) (g) (n)	recrystallize(d) (recrystallizing) (recrystallization)
pl.	plate(s)		
polym.(n)	polymer; polymerize; polymerized (polymerization)	rect.	rectangular
		redis.	redissolve

sym.	symmetrical		wt.	weight
sym-	stereochemical opposite of anti-			Y
yst.	system; systematic; systematically		yel.	yellow

## MEMORANDUM OF CERTAIN 1946-1947 REFERENCES NOT INCORPORATED IN REGULAR TEXT

The regular text of this book is made up of references selected from the chemical literature through the year 1945. Owing to the disturbed postwar conditions of the publishing and printing trades, and also to the exceptional difficulty and magnitude of this work, almost three years have elapsed since the termination of the period of writing of the organized text. Inevitably, there have appeared during this period many scientific papers whose content would gladly have been incorporated appropriately in the regular text. For practical reasons, however, such continuous adjustment was obviously impossible.

In an effort to avoid so far as possible complete loss of such material, however, certain of the more important papers which have come to the attention of the author during the 1946-1947 period have been listed in the following supplementary bibliography. Articles relevant to more than a single numbered compound are cited under the first in such a numerical series, cross-references being given under subsequent compounds to avoid excess duplication of references. In the interests of brevity, clarity, and consistency of nomenclature, slight modifications of the actual titles of the original papers have sometimes been made for purposes of this listing.

### General

- (1) Table of azeotropes and nonazeotropes  
*Hopkins, Ind. Eng. Chem., Anal. Ed.* **19**, 500-500 (1947)  
 . . . . . its accompanying formula index and  
 . . . . . valuable and includes so many of the  
 . . . . . that it is placed at the head of this supplementary reference list without further cross-reference to it from subsequent entries below.
- 3:0075  $\delta$ -Chloro-*n*-valeric acid  
 (2) Isomeric chlorinated long-chain esters  
*Guest, J. Am. Chem. Soc.* **69**, 300-302 (1947)  
 —Methyl  $\delta$ -chloro-*n*-valerate: b.p. 89-92° at 18 mm. [From  $\delta$ -chloro-*n*-valeronitrile 80%  $H_2SO_4$  refluxed 50 hr.]
- 3:0235  $\alpha$ -Chloroisobutyric acid  
 (3) The chloro- and bromoisobutyronitriles  
*Stevens, J. Am. Chem. Soc.* **70**, 166 (1948)  
 Ⓓ  $\alpha$ -Chloroisobutyramide: cryst. from EtOAc, m.p. 115-118°; from aq., m.p. 117-119°.  
 [From  $\alpha$ -chloroisobutyryl chloride (3:5385) with conc.  $NH_4OH$  at 10° in 70% yield]
- 3:0280 Chloromaleic anhydride  
 (4) Use of  $\bar{C}$  in determination of conjugated diolefins  
*Putnam, Moss, Hall, Ind. Eng. Chem., Anal. Ed.* **18**, 628-630 (1946)

- [illegible]

- (29) Determination of C as spray residue on fresh fruit by three independent methods  
Wichmann, Patterson, Clifford, Klein, Claborn, *J. Assoc. Offic. Agr. Chemists* 29,  
188-190 (1946); *C.A.* 40, 6705 (1946)
- Method 1. Organic chlorine determinations  
Klein, Wichmann, *ibid.* 29, 191-195 (1946); *C.A.* 40, 6705 (1946)
- Method 2. The Shechter-Haller colorimetric procedure  
Clifford, *ibid.* 29, 195-206 (1946); *C.A.* 40, 6705 (1946)
- Method 3. 2,4-Dinitrophenylhydrazine method  
Claborn, Patterson, *ibid.* 29, 206-218 (1946); *C.A.* 40, 6705 (1946)
- (30) Decomposition and volatility of C̄ and some of its derivatives  
Wichmann, Patterson, Clifford, Klein, Claborn, *J. Assoc. Offic. Agr. Chemists* 29,  
216-222 (1946); *C.A.* 40, 6710 (1946)
- (31)  
  
-53 (1947)
- (32)
- (33) Determination of C̄ by Shechter procedure, particularly in milk and fats  
Clifford, *J. Assoc. Offic. Agr. Chemists* 30, 337-349 (1947); *C.A.* 41, 6839 (1947)
- (34) Nature of the hy-products in technical C̄  
Gäzi, Stammbach, *Helv. Chim. Acta*, 29, 563-572 (1946), *Experientia* 1, 276 (1945).  
*C.A.* 40, 5040-5041 (1946)
- (35) Simple purification procedure for C̄  
K. H. Cook, W. A. Cook, *J. Am. Chem. Soc.* 68, 1663-1664 (1946)
- (36) Applications of infrared spectroscopy to C̄  
Downing, Freed, Walker, Patterson, *Ind. Eng. Chem., Anal. Ed.* 18, 461-467 (1946)
- (37) Some derivatives of C̄  
Backeberg, Marus, *J. Chem. Soc.* 1945, 803-805; *C.A.* 40, 1156, 5717 (1946)
- (38) Bromine analogs of C̄  
Cristol, Haller, *J. Am. Chem. Soc.* 68, 140-141 (1946)
- (39) Crystal structure of C̄ and relatives  
Wild, Brandenberger, *Helv. Chim. Acta* 29, 1024-1040 (1946), *C.A.* 41, 42S (1947)
- (40) Syntheses of some analogs of C̄  
Kirkwood, Dacey, *Can. J. Research* 24-B, 69-72 (1946); *C.A.* 40, 5717 (1946)
- (41) Catalytic decomposition of C̄  
Fleener, *J. Am. Chem. Soc.* 68, 2393 (1946)
- (42) Inhibition of catalyzed thermal decomposition of C̄  
Gunther, Tow, *J. Soc. Chem. Ind.* 66, 57-59 (1947), *C.A.* 41, 5675 (1947)
- (43) Dehydrohalogenation of C̄  
Wain, Martin, *Nature* 159, 68-69 (1947); *C.A.* 41, 2715 (1947)
- (44) Estimation of C̄ by methods depending upon dehydrohalogenation  
Wain, Martin, *Analyst* 72, 1-6 (1947); *C.A.* 41, 2198 (1947)
- (45) Preparation of di-(p-chlorophenyl)acetic acid from C̄  
Grummitt, Burk, Egan, *Org. Synthesis* 26, 21-23 (1946)
- (46) Reactions of C̄ and associated compounds  
Forrest, Stephenson, Waters, *J. Chem. Soc.* 1946, 333-339; *C.A.* 40, 5035-5040 (1946)
- (47) Crystallization of C̄ from binary melts  
Gulpin, McCrone, Smedal, Grant, *J. Am. Chem. Soc.* 70, 208-211 (1947)
- 3:3376** 1,1-Dichloro-2,2-di-(p-chlorophenyl)ethane ("DDD")
- (48) Anhydrous FeCl₃ as rearrangement catalyst for some chlorinated diphenylethenes  
Floek, *J. Org. Chem.* 12, 70-712 (1947)
- 3:3380** 4,4-Dichlororesorcinol
- (49) For preparation of isomeric 2,4-dichlororesorcinol see  
Peetevin, Kuchina, *J. Gen. Chem. (U.S.S.R.)* 17, 278-282 (1947); *C.A.* 42, 534-535  
(1948)
- 3:3384** p-Phenylenecarbonyl chloride
- (50) Conversion of C̄ to p-phenylene carbonyl iodide  
Rheinholdt, Perrier, *J. Am. Chem. Soc.* 69, 3145-3149 (1947)
- 3:4053** 2,4-Dichlorophenoxyacetic acid

are also present, a compound is said to belong to a higher order: e.g., compounds of carbon with both hydrogen and nitrogen, with oxygen and nitrogen, or with hydrogen, oxygen, and nitrogen comprise Order 2. A systematic arrangement of still higher orders has been developed but need not be fully amplified here.

The substance of the present volume is concerned primarily with compounds of Order 3, i.e., with compounds containing carbon and chlorine; carbon, oxygen, and chlorine; carbon, hydrogen, and chlorine; or carbon, hydrogen, oxygen, and chlorine. To all such compounds deemed of sufficiently general interest to warrant detailed treatment in this book, serial numbers have been assigned as later explained. Although such serial numbers are thus restricted to species of Order 3, a vast number of compounds belonging to other orders inevitably occurs in the course of the individual texts so that this volume has far wider utility than might at first glance be supposed. At the same time not all substances belonging to Order 3 are given numbers since many are not of sufficient value to warrant such extensive treatment.

## 2. The matter of suborders

In the general plan of ordinal classification, it is sometimes (but not always) useful to effect subdivision of orders into two suborders according to whether or not the pure compounds are colored. For both Orders 1 and 2, such subordering has special merit. For the present Order 3 compounds, however, the proportion of colored individuals is almost negligible, and employment of suborders has been avoided.

## 3. The arrangement of compounds of Order 3 into *divisions*

Just as the individual compounds of Order 1 were ultimately further subclassified into various *genera*, each characterized by a common behavior in certain prescribed and carefully defined *generic tests*, so it would of course be perfectly possible to set up an analogous series of genera for any or all of the higher orders. After considerable reflection and experimentation, however, such extension of the method of generic subclassification has seemed an extravagant formality whose added value for the higher orders does not warrant its establishment. Consequently, the individuals comprising the present Order 3 are not arranged by genera, and there are no standardized generic tests to be systematically applied.

Instead of arrangement by genera, therefore, the compounds assigned serial numbers in this book are arranged in three *divisions*. The first of these divisions comprises members of Order 3 which, when pure, are normally solids with at least reasonably definite melting points. The second comprises members of Order 3 which, when pure, are liquids with boiling points attainable and recorded at ordinary pressure. The third division comprises

### 3 THE SEQUENCE OF COMPOUNDS WITHIN THE THREE DIVISIONS

members of Order 3 which, even when pure, are liquids which either cannot be distilled at atmospheric pressure without serious decomposition or for which such data are available only under reduced pressure. Ample cross-references connecting the solid and liquid divisions facilitate recognition of appropriate cases.

#### 4. The sequence of compounds within the three divisions

**DIVISION A.** The individual solids constituting Division A are arranged in the order of increasing magnitude of their respective melting points. For compounds on which there is poor agreement regarding the true melting point, the value determining the position of the compound relative to its neighbors is not necessarily the highest listed. Values printed within square brackets have been regarded by the author on the collateral evidence as possibly doubtful, and such constants have been discounted in assigning positional sequence to the compound.

**DIVISION B.** This division, comprising liquids of Order 3 with boiling points at ordinary pressure, is (unlike either its predecessor or successor) further subdivided into two sections according to the specific gravity at 20°C. referred to water at 4°C. Section 1 contains such liquids with values of  $D_4^{20}$  greater than 1.15; Section 2 contains correspondingly those liquids for which the value of  $D_4^{20}$  is less than 1.15. Within each of the sections of Division B the individual species are arranged in the order of increasing magnitude of their respective boiling points, preferably at 760 mm. pressure. For compounds whose boiling points at this standard pressure are unreported, no attempt has been made to calculate over since to do so seems likely to introduce serious uncertainties.

**DIVISION C.** This division contains all serially numbered compounds of Order 3 which have not been allocated to either of the preceding divisions, such cases usually comprising liquids for which boiling points are reported only at reduced pressures. Within this division an entirely different method of establishing the listing sequence is employed; viz., the compounds are listed in ascending sequence according to the composition of their empirical formulas. For any given number of carbon atoms, compounds containing carbon and chlorine, or carbon, oxygen, and chlorine, or carbon, hydrogen, and chlorine, or carbon, hydrogen, oxygen, and chlorine fall in that sequence. Within any one of these four subgroups the sequence is determined by increasing magnitude of the number of component atoms in the sequence (as above) of carbon, hydrogen, oxygen, and chlorine. Although expressed in words this sounds formidable, even casual inspection of the Tables or of the Empirical Formula Index quickly supplies convincing evidence of its complete simplicity in actual practice.

## 5. The arrangement of data on individual compounds

Whether the amount of data for the compounds comprising this volume is large or small, and irrespective of numerous variations of details, a certain standard form may be recognized as common to all. This form may be construed as made up of the following five elements:

- A. The heading.
- B. Fundamental physical constants.
- C. General data on other constants, preparation and properties.
- D. Designation of special or preliminary tests.
- E. Derivatives.
- F. References to the original literature.

The relative amount of space devoted to these five aspects varies according to circumstances. Each is discussed below in much further detail.

### A. The heading

The heading of each numbered compound comprises (in its most general form) five components which always occur in the following sequence from left to right, viz.,

1. Location number of compound in this book (Order 3)	2. Name (or names)	3. Structural formula	4. Empirical formula	5. Beilstein reference
---	--------------------------	--------------------------	-------------------------	---------------------------

(1) *The location number.* Each compound on which detailed treatment is given in this book has been assigned an arbitrary number to facilitate frequent cross reference in indexes and other parts of the text. This number consists of a digit representing the order of the compound (thus all species of this volume have location numbers beginning with 3), followed by a colon and then a four-digit arbitrary number. The system is, therefore, entirely comparable to a telephone number, the initial digit preceding the colon corresponding to an exchange, the four following digits corresponding to an individual line.

In assigning serial location numbers to the various individuals treated in this book, a principle has been maintained whose recognition greatly facilitates recognition of the physical nature of the corresponding substances. All members of Division 1 (solids) carry numbers between 1 and 4999; all members of Division 2, Section 1, are between 5000 and 6999; all members of Division 2, Section 2, are between 7000 and 8999; all members of Division 3 are between 9000 and 9999.

For a given compound, the full descriptive data are recorded only in one place, i.e., in that corresponding to the location number. When occasion

arises to be reminded in some other portion of the book of certain properties of a given compound, the *heading only* is repeated followed by a cross reference to the place of detailed description, the section usually occupied by the location number being indicated merely by a dash. The most frequent occasion for this type of cross reference is to indicate the boiling point of a compound normally met with as a solid, or alternatively the melting point of a substance normally met as a liquid.

(2) *The name (or names) of the compound.* The second element of the heading is devoted to the name (or names) of the compound. Out of all possible names, one (regarded for the purposes of this book as the "principal name") has been printed in bold-face capitals.

In many instances, however, this principal name is followed in ordinary type by one or more other names which are in common use and which might occur alternatively to users of this volume. All these names are appropriately entered in the alphabetical name index so that the location number is readily obtained irrespective of which name may be sought by the user.

(3) *The structural formula of the compound.* Since it is frequently easier to interpret the chemical reactions of a compound by contemplation of its structural formula rather than its name, such structural pictures are given for all compounds in this volume.

If a particular compound reacts as if it had two different structures, both are pictured.

Although such structural formulations are construed as the third element of the heading of each compound, it may happen that, owing to practical space considerations, the picture is not actually printed as part of the top line but depressed somewhat below it.

(4) *The empirical formula.* The fourth element of the heading is the empirical formula. This will be found useful in many ways, particularly in suggesting (especially with the amplification afforded by the empirical formula index) isomeric compounds from which distinction must be made, and in searching the abstract periodicals for data reported after the publication of this volume.

(5) *The Beilstein reference.* Each compound listed in these *Tables* carries in the upper right-hand corner as the fifth element of the heading reference to Beilstein's *Handbuch der organischen Chemie*. All such references designate the fourth edition of this important tool.

At the time of preparation of these *Tables*, all twenty-seven volumes of the primary series (covering the literature up to 1910) together with the corresponding twenty-seven volumes of the first supplementary series (1910-1919, inclusive) of Beilstein's *Handbuch* were available. For every numbered compound of these *Tables* which appears in either the main or first supple-

mentary series, the Beilstein reference will comprise two parts, the first giving the volume and page in the main series, the second giving corresponding reference to the first supplementary series. To distinguish the latter, the volume reference carries the subscript 1, and the page reference is placed between parentheses to indicate that the regular pagination of such supplementary volume is designated.

In addition to the main and first supplementary series of Beilstein mentioned above, there were also available during the preparation of these *Tables* the first five volumes of the second supplementary series (1920-1929) of Beilstein's *Handbuch*. For such of the present numbered compounds as were treated in this available fragment, the Beilstein reference will, therefore, contain a third element representing the volume and page involved. For this kind of case the volume reference bears the subscript 2 (to indicate second supplementary series) together with the page reference in parentheses as before.

In accordance with the above explanation, a given compound will have either two or three Beilstein references. It is, of course, possible for a compound to have citation to only one or two out of the three maximum possibilities; absence of any data for a particular Beilstein unit is indicated by short dashes after the volume number.

The remaining possible case is that in which the compound in question is of such recent origin that Beilstein contains no reference to it either in the main section or either supplementary series. Many such compounds occur in this Order 3. Under these circumstances the usual Beilstein citation is replaced by the Beilstein System Number of the compound, e.g., Beil. S.N. 644. Such type of reference immediately indicates that no reference to the substance is contained in any Beilstein issues through Vol. V of the second supplementary series. Whenever third, fourth, or later supplementary series become available, however, this system number will indicate the position of the compound within narrow limits, even though volume and page cannot now be predicted.

The practice of giving all three Beilstein citations wherever possible serves as a continual reminder that to look merely in the main series volume of Beilstein yields material only up to 1910; for the next two decades the corresponding first and second supplements must also be examined. In this respect these *Tables of Order 3* extend the practice of those of Order 1, where only the main series citation was made, extension to the first supplement being left to the user.

That these references to Beilstein's *Handbuch* are here included only as an additional convenience to users of these *Tables* should be clearly understood. This book is wholly independent of Beilstein, and those users to whom Beilstein may be inaccessible are reassured that the value of these *Tables* to them is in no way impaired.

*B. Fundamental physical constants*

The five components of the standard heading having been discussed, some comment upon the next element of each description is required. This next element comprises what are here designated as "fundamental physical constants" and which in the most general cases consist of data on (1) the melting point, (2) boiling point, (3) density, and (4) refractive index. In the sequence named, these are arranged in four vertical columns from left to right of a given page. For substances which are solids under ordinary conditions, the melting-point column is the first at the left of the page with the boiling-point column next following in the left central section. For such solids only rarely will density or refractive index data appear. For liquids, however, the first left-hand column is devoted to boiling-point data, the melting points being displaced to the next right-hand column because of their subordinate value in such instances.

(1) *The melting point.* Whereas in the earlier *Tables of Order 1* the general practice was to express only a single figure for this constant, the individual descriptions of this book include substantially all values that have been reported. However, values which in the light of collective subsequent results are certainly too low, or those which because of their wide range make no claim to accuracy, are omitted. The survey of values thus set forth, together with the fact that the source of each value is also given, permits the user to form his own opinion concerning the magnitude, degree of concordance, and precision of the available data.

For each individual compound the several values are arranged in the order of diminishing numerical magnitude. In general the value of highest magnitude is employed to determine the place of the individual solid relative to its fellows (i.e., to determine its serial location number). However, values enclosed by square brackets are regarded by the author on collateral evidence as being abnormally high, and such constants are ignored in establishing the serial number of the individual.

The several melting points are recorded here just as they are reported in the original literature; whenever the designations *corrected* or *uncorrected* were included in the original source, they are repeated here; most of the values, however, fail to specify whether they are corrected or not. This careless usage of much journal literature is to be deplored.

No attempt has been made in this book generally to maintain a distinction between melting point and freezing point. Undoubtedly, most of the values reported represent conventional capillary-tube melting points; frequently, however, the values are expressed to a degree of precision suggesting that a cooling-curve method was employed. Whenever the distinction is of importance, the user can readily ascertain full details from the cited references.

(2) *The boiling point.* In complete analogy with its treatment of melting points, the individual descriptions of this book include substantially all recorded values of the boiling point. These are tabulated in the order of diminishing numerical magnitude of the prevailing pressures. Wherever the data can be found, the value at 760 mm. pressure is cited; however, if this is not directly reported, no attempt has been made to convert the available figures over to that pressure, as to do so would introduce unwarranted assumptions. Values of the boiling point at various pressures are meticulously included in the *Tables*. However, when a careful physicochemical study has been made of the vapor pressure of an individual, selected values are printed and reference made to the original for further detail.

Even a casual examination of the boiling point data reported in this book leads at once to the conviction that there has been a great variation in the precision of measurement of the prevailing pressure over the boiling liquid. In fact an incredible proportion of workers has not reported any pressure figures at all or complacently referred to the "prevailing atmospheric pressure." Even when pressure measurements are reported, the evident general lack of concordance becomes distressing evidence of the inadequacy and inaccuracy of many of the data in the literature.

(3) *Densities.* Unlike the extensive treatment accorded for melting points and boiling points, this book does not attempt to tabulate all possible published values for the densities of liquid compounds. However, all available data for density at 20°C. referred to water at 4°C. are given; and, whenever possible, the same procedure is extended to values for  $D_4^{25}$  and  $D_4^{15}$ . Note that, when values are given for various temperatures, those for the highest temperature are printed at the top of the density column, followed in diminishing magnitude of temperature by the other values. This simple and obvious device is intended to assist users of these *Tables*, but they should be reminded that this plan was not (unfortunately) employed with the *Tables of Order 1*.

Density data are given for all liquids for which they can be found; for compounds normally solid, the density is occasionally given for some temperature above the melting point, especially if refractive index values at the same temperature are also available.

Whenever in an original paper there exists any uncertainty as to the temperature of the water with which comparison is made, the lower subscript is replaced by a short dash to indicate that the omission of this figure is not accidental but is because of inadequate expression in the original. In many or even most such cases it is possible that the author intended to convey that the density was expressed with respect to water at the same temperature. This author, however, declines to make any such assumption and ventures to express the view that research workers and journal editors should insist upon unambiguous expression of such data.

(4) *Refractive indices.* These are usually given in the form  $n_D^{20}$ , i.e., the refractive index determined at 20°C. with the D line of sodium light. In some instances data for other lines of the spectrum have been reported here when no data on the D line were available. As with the densities above, refractive index data are frequently printed for other temperatures, and the same typographical convention of placing the higher-temperature values above the lower-temperature ones is continued.

### *C. General data on other constants, preparation, and properties*

The preceding details of the five components of the heading and the four so-called fundamental constants having been discussed, it is now desirable to comment upon the third element of the text of each compound. The material comprising this third section actually comprises most of the space of this book. Although sometimes consisting of only a few paragraphs, there are many members of Order 3 for which the general exposition of behavior requires many pages. Such extended treatments are frequently (although not invariably) subdivided by major and minor headings intended to facilitate quick recognition of the probable location of particular types of desired information. Careful examination of the text of any typical individual compound will quickly disclose that it has in general been dealt with in generous fashion. At the same time it is obvious that a line must be drawn somewhere. For example, in connection with the discussion of an alkyl halide such as *n*-butyl chloride, it is certainly of highest relevance to indicate the mode and extent of its ability to form *n*-butyl magnesium chloride. Furthermore, the value of the simpler reactions of the RMgCl compounds, particularly with reference to their utility in the identification of the initial halide itself, is evident, but on the other hand no attempt has been made to cover all the known reactions of butyl magnesium chloride since that would involve an undertaking of disproportionate magnitude.

Although details of the texts of individual compounds naturally differ in nature and magnitude and are influenced by the literature content corresponding to the direction of published research, certain aspects occur with sufficient frequency to warrant comment.

The text of each compound invariably comprises its methods of preparation and its chemical behavior. For many of the more common or especially important species, these two aspects are often preceded by an introductory section containing certain physical data (in addition to that of the heading) likely to be of particular interest or utility to organic chemists. Examples of such entries include binary and ternary systems with other compounds, especially with reference to freezing-point composition data, azeotropes, densities and/or refractive indices, etc. In this introductory section also attention is frequently directed to methods of quantitative determination

of the compound, examples of industrial or other utilization, biochemical behavior especially with regard to studies on toxicity, antiseptic character, etc. The selection of entries for this introductory section is admittedly arbitrary, and users are reminded that this book makes no claim to include all known data even on the compounds to which serial numbers are assigned. Indeed, in an effort to keep the volume within reasonable bounds, certain types of data of value to organic chemists have been deliberately (though regretfully) excluded, such as references to absorption or Raman spectra, dipole moments, and viscosities, although many instances of the four fundamental physical constants of the heading are drawn from original publications primarily concerned with these aspects.

Within the text of each individual numbered compound (immediately following the above-mentioned introductory section, if any), there occurs a section on its methods of preparation. This treatment has purposely been made as complete as possible. To a limited degree distinction has been made between preparation and formation; but, because even in contemporary publications many authors fail to report yields, adequate recognition of the appropriate category is not always possible. Original results reported only in terms of weight have been calculated over to percentage yields. Variations in yields by a single method of preparation are contrasted by massing them in the text, the uniform practice of following each statement with its corresponding citation serving conveniently to associate each yield with a particular modification. With compounds for which there are many modes of preparation, the most generally practicable methods are often singled out for particular mention at the beginning of the preparative section, followed by a systematic presentation of all the recorded methods under various sub-headings appropriate to the circumstances.

Users of this book will find these sections on preparation not only extremely useful from the viewpoint of comparison of various alternatives but also very stimulating and suggestive in the formulation of unconventional approaches to their particular problems.

Within the text of each numbered compound of this book, following the introductory section (if any) and the preparative section, is next set forth the significant aspects of its chemical behavior. The length of this part of the treatment varies widely from a few phrases to many pages. Very long treatments are appropriately subdivided for practical convenience, the particular sequence of arrangement being dictated by various circumstances. For example, the earlier subdivisions often deal with pyrolysis, reduction, oxidation, and substitution reactions, followed by the behavior with inorganic and organic reactants. With bifunctional compounds the initial group is frequently followed by the behavior of each function with inorganic and organic reactants in that order. Users will experience no difficulty in recognizing

the systematic organization of each compound. Emphasis has been placed upon a systematic and logical presentation of each case, and the above general outline has served the construction of this book only as a general guide rather than a rigid frame.

Two matters continually arising within the descriptive text deserve a further word of comment. The first relates to the fact that, in the course of reporting the chemical behavior of each numbered compound, there is necessarily involved reference to many other substances. Such of these as appear in either this volume (Order 3) or its predecessor (Order 1) are immediately followed by their serial numbers. A great many other compounds belonging to orders not yet written up in this series are inevitably involved; for such compounds reference to Beilstein is usually made for the convenience of the user who may have occasion to follow the matter further.

The second matter involves the practice of this book with respect to citations. Many instances appear which at first glance might appear to involve unnecessary repetition of the citation number, but which really comprise signals to the reader. As a simple illustration, consider the following extract from the text of *p*-chlorophenol, referring to the method of preparation of its *N*-(*m*-nitrophenyl)carbamate, viz.: "From  $\bar{C}$  with *m*-nitrobenzazido (283) or *m*-nitrophenyl isocyanate (283) in lgr. (283)." This usage designates the fact that the preparation of both the *m*-nitrobenzazido and the *m*-nitrophenyl isocyanate is given in reference (283) together with their utilization as reagents in the conversion of *p*-chlorophenol to the corresponding *N*-(*m*-nitrophenyl)carbamate. Of course, with commonly available reagents such extra citations need not be included.

In view of the nature and magnitude of the text of this book, there may be a tendency to regard it as a specialized Beilstein within its field. Such a characterization would carry the implication that the text comprises all known chemical information with respect to each component compound, whereas only the more important representatives of such data are offered. In this connection one common misunderstanding with respect to Beilstein's *Handbuch* has significance. The Beilstein classification employs the principle of "latest position in the system." This means that, when a given fact could logically be placed in several different places, it is in general associated with the last of such places in the systematic plan. For example, as the methyl ether of phenol, anisole could conceivably be discussed either under methyl alcohol or under phenol. Following the above principle, however, Beilstein discusses it under phenol with no mention whatever under methyl alcohol. For Beilstein's purpose this principle is extremely well founded, results in an orderly, systematic, and uniform procedure, and, if properly understood, causes no trouble to the user. Its employment does have the unfortunate result, however, that for compounds occurring early in the

systematic sequence the impression is often given to the uninitiated that nothing is known about reactions involving components themselves listed later in the classification scheme. In contrast to the above Beilstein usage, the present *Tables* are unrestricted by any such arbitrary rule. Inasmuch as a large proportion of the compounds with which it deals are those which in the Beilstein classification appear to be inadequately described because of their earlier position in the sequence, users will quickly appreciate the added convenience of a generous treatment of the chemistry involved.

#### *D. Preliminary tests*

For certain of the more common compounds included in these *Tables*, there exist specific or semi-specific color tests. These are generally simple to execute, may often be applied satisfactorily to minute amounts of material, and, when positive, are so significant that their trial, if indicated, should invariably precede the derivatization of the sample. Such tests are indicated by the symbol © but should be regarded as merely preliminary in character and not always carrying the same conviction as the derivatives.

#### *E. Derivatives*

The text section of each numbered compound is usually concluded by a group of derivatives. Those which for one reason or another have special importance are designated by the symbol © placed at the left-hand side of the page. Interspersed with such cases will frequently be found others not bearing this symbol but instead merely designated by a dash. Relatives of the original parent compound so designated comprise materials, knowledge of whose existence (or less commonly nonexistence) or properties may be needed for comparison with related cases for the particular parent or other isomers thereof. Wherever possible, specific data on each relative included in this derivative section are given; in many cases, however, where careful systematic search has failed to uncover any published record of the compound, it is characterized in these tables as "unreported." All chemists recognize that reliable information that a particular compound has not yet been reported is more to be desired than its complete omission; and this feature of this volume will effect substantial economies of time for its users. Naturally, as time goes by the constant publication of new data will enable some of these informational gaps to be filled.

More than one value for the melting point of a particular product derived from a numbered parent or, conversely, several citations for the same value will often be noted through all parts of this book. These practices serve, respectively, to suggest caution because of lack of agreement and to attract attention to the concordance of results of several different workers.

The sequence in which these derivatives are listed has no relation to their

respective merits as means of identification of the particular parent. For each class of compounds, the particular sequence is arbitrary but standard in form and sequence in order to facilitate intercomparison and easy reference. For any particular class, however, the sequence is similar to that employed in Order 1 for the corresponding nonchlorinated parent.

#### F. Literature references

The fifth and final section of the descriptive material comprising each serially numbered compound comprises the corresponding references to the chemical literature. These are associated with the corresponding portions of the descriptive text by arbitrary numbers set in bold-face carets, e.g. (5), the journal names being uniformly represented by the standard abbreviations employed by *Chemical Abstracts*. The single exception to the use of *Chemical Abstracts* abbreviations for literature references is that the German journal recently known as *Chemisches Zentralblatt* (but formerly as *Chemisches Centralblatt*) is here designated as *Cent.* This convention adequately suggests the name of the periodical in less space and improves the corresponding Beilstein abbreviation (C.) by avoiding confusion with Centigrade temperature.

The total number of such literature references in this book is very large, owing in part to the greatly increased scope of this Order 3 as compared with the restricted treatment of compounds of Order 1. It will be observed that, in addition to a much fuller record of the four fundamental physical constants, and a more generous regard for a diversified array of derivatives, this book (unlike its predecessor) deals extensively with the preparation and chemical behavior of its component species. Furthermore, whereas the earlier book arbitrarily excluded references to the patent literature, the present volume not only permits their inclusion but draws rather heavily upon it. The rapid growth of industrial organic chemistry, the fact that numerous chloro compounds of Order 3 represent individuals of great industrial significance, and the circumstances that for many such cases a large proportion of the available information is of such recent origin that little of it can be found in conventional monographs or other compendia have combined to necessitate considerable emphasis on the technical literature.

For a given individual numbered compound, a particular published article or patent is listed *only once*. The citation number representing the reference may be given many times in the descriptive text, but in the literature reference section the reference itself is not repeated. On the other hand, a given original article covering several individual compounds included in this book will be cited under each of the materials to which the article is relevant.

The order in which the literature references are arranged is determined by the sequence in which necessity for their mention arises in the text. This

results, of course, in what may appear to be a random sequence. The author is well aware that rearrangement of these references into a sequence comprising an alphabetical author index is possible. Such an operation, however, has been regarded as impracticable since it would multiply severalfold the opportunity for error and would be unlikely to confer advantages commensurate with the labor involved.

Literature references to journals considered to be generally accessible are given directly; but those to articles in journals with limited circulation or to articles in languages other than English, German, French, or Italian are usually accompanied by the location of the corresponding abstract in both the *Chemisches Centralblatt* and the *Chemical Abstracts*. This leads to the suggestion that users of this book, to whom a particular primary publication may be inaccessible, may themselves locate the corresponding abstracts by means of the usual Author Indexes to these works. Consultation of the abstract must never be regarded as equivalent to examination of the original publication but is generally better than no information at all.

Citations to original articles in scientific journals often refer to individual pages but sometimes also to a spread of pages, depending upon the nature of the article. The practice so frequently employed by others of citing an article merely by giving its initial page and leaving to the reader the often laborious job of locating the individual page germane to the aspect in question is deplored by the present author and has been avoided in this book. When a page spread (occasionally extending to the whole of a particular article) is cited, the reason is usually that the construction of the original paper is such that relevant material is scattered throughout the paper and individual page citation might be not only inadequate but even misleading. Since a given article appears (in general) but once in the group of literature references associated with each numbered compound, however, and since therefore the single number representing it may be used many times during the various aspects of the corresponding text, users finding that one of several individual pages so cited is inapplicable will recognize it is to be associated with some other aspect elsewhere in the text.

Attention is called to certain advantageous and unique practices followed by this book in connection with its citations of patents. The first element of patent citation is the name of the inventor (or of all, if more than one) if this information is known. The second element comprises the name of the company to which the patent has been assigned. All American patents are required by law to be issued to the inventors but are commonly assigned to the sponsor of the work. Foreign patents, however, do not always carry the names of individual inventors; in that event the company name has to serve both purposes. The third element is the nationality and number of the patent accompanied by its date of issue (not application). The fourth

element comprises reference to abstracts of the patent both in the *Chemisches Centralblatt* and in *Chemical Abstracts*. There are three reasons for this multiple form of abstract reference.

The first is that few chemists have immediate access to the corresponding original patents themselves and appreciate the convenience of the abstract. The second is the plain fact that the patent abstracts published by the *Chemisches Centralblatt* are usually so much more descriptive and more nearly complete than those of *Chemical Abstracts* that many chemists prefer to use the former. Doubters of this difference of quality between the two abstract journals are invited to convince themselves by direct comparison. Finally, the *Chemical Abstracts* reference is also included, however, because there may be some users of this book to whom the *Centralblatt* may not be available or who are timid about their ability to read even technical German. If in a particular case the patent has not been abstracted at all, this fact is also noted. Furthermore, because of the present inaccessibility of more recent issues of the *Centralblatt*, it has been necessary in some of the more recent references to cite only *Chemical Abstracts*.

In connection with the citation of patents, many instances will be noted in which the reference includes also the equivalent patents of other countries, each of these being accompanied by its dates, abstract references, etc., as for an individual patent.

The reader's attention is directed to the obvious fact that many patents are expressed in general terms so that, even though the protection sought may frequently cover one or more of the component compounds of this book, the specific individuals are not mentioned by name. No attempt has been made to interpret such general patents. For this reason systematic searchers will often consult higher or lower homologs of the compound comprising their initial interest.

## 6. Abbreviations

Necessity for economy of space has required in this book a continuation of the extensive set of abbreviations used with the earlier *Tables of Order 1* together with certain additions required by new circumstances. All these abbreviations have been selected so as to suggest the full word, particularly when assisted by the context. No attempt has been made to enslave the text to the abbreviations, however, and the full word is sometimes employed even though a mnemonic for it is given in the *Table of Abbreviations*.

## 7. Indexes

This book contains five different types of indexes; three of these are distinctly novel and two are conventional, as explained below.

### A. *The empirical formula index*

The index of empirical formulas lists each of the compounds in this book in the conventional familiar form under one or another of four parts according to whether the particular compound contains (1) only carbon and chlorine; (2) carbon, oxygen, and chlorine; (3) carbon, hydrogen, and chlorine; (4) carbon, hydrogen, oxygen, and chlorine. Within each of these parts the individual empirical formulas are arranged in groups according to increasing numbers of carbon atoms, and for a given number of carbon atoms according to increasing numbers of the other component atoms. Within each group of isomeric compounds the order of listing follows the sequence of the eight units comprising the Chemical Type Index (see below).

This empirical formula index contains also for each group of isomers both the molecular weight and the percentage chlorine content, each computed to one place of decimal units. This index not only serves as a convenient record of these constants but also suggests to the user isomers of the particular individual. The formula index may also be employed occasionally as a final verification of the presence or absence of a particular compound from the *Tables*, in possible instances where the names which occur to the worker do not appear in the alphabetical index.

A brief statistical analysis of this index may be of interest. The 1320 individual compounds comprising this book are distributed among 366 groups of isomers as follows:

	GROUPS OF ISOMERS	INDIVIDUALS
Part A C/Cl compounds	11	11
Part B C/O/Cl compounds	18	21
Part C C/H/Cl compounds	135	566
Part D C/H/O/Cl compounds	202	722
Total	366	1320

The minimum number of isomers for a given empirical formula is obviously one; 28 of the above 366 groups represent such minimum cases. The maximum possible number of individual compounds within a particular empirical formula is, of course, indeterminately large; however, it is of interest to note that, of the 366 groups of isomers in this book, the largest number of individual compounds (21) occurs for the empirical formula  $C_8H_7O_2Cl$ . Other formulas with substantial numbers of individuals comprise  $C_5H_9O_2Cl$  with 20,  $C_7H_{15}Cl$  and  $C_8H_{17}Cl$  each with 18,  $C_5H_{10}Cl_2$  with 17, and  $C_6H_{11}Cl$ ,  $C_6H_{13}Cl$ , and  $C_6H_9OCl$  each with 16, corresponding to a particular molecular weight.

### B. *Index of empirical formulas by percentage chlorine content*

This index lists the 366 empirical formulas of the numbered compounds contained in this book in order of diminishing percentage of chlorine. This

type of index is unique; nothing of this sort exists in any other publication so far as is known. Many uses of such an index will suggest themselves, the most obvious example being to suggest various empirical formulas corresponding to a particular chlorine content.

Within this index will be observed many examples of identical chlorine contents for several different formulas; e.g., a percentage chlorine of 37.5 is common to the four different formulas  $C_2H_3O_2Cl$ ,  $C_3H_7OCl$ ,  $C_8H_6OCl_2$ , and  $C_{14}H_9Cl_3$ , despite the fact (as seen from the Empirical Formula Index) that the molecular weights of the last two are quite different from the others.

### *C. Index of empirical formulas by molecular weights*

This index lists the 366 empirical formulas of the numbered compounds contained in this book in order of increasing magnitude of molecular weight. This index (like the preceding one) is unique, and nothing of the sort exists in any other publication so far as is known. Many uses of this index will suggest themselves, the most obvious example being to suggest various empirical formulas having the same molecular magnitude.

Within this index will also be observed many examples of identical molecular weights for several different formulas; e.g., the molecular weight of 136.6 is common to the three different formulas  $C_5H_9O_2Cl$ ,  $C_6H_{13}OCl$ , and  $C_8H_5Cl$ .

### *D. Index of compounds according to chemical types*

Since, as more fully explained earlier in this chapter, the component individuals of this book are not arranged in arbitrary genera and no standardized generic tests comparable to those of Order 1 have as yet been developed, the inclusion in this volume of an index in which the compounds are arranged according to the chemical classes to which they belong is of special value and utility.

In this chemical-type index, each compound is listed in at least one of eight chemical classes (units) as follows:

- Unit 1. Chloro substitution products of saturated acyclic hydrocarbons.
- Unit 2. Chloro substitution products of unsaturated acyclic hydrocarbons.
- Unit 3. Chloro substitution products of cyclic hydrocarbons.
- Unit 4. Chloro substitution products of hydroxy compounds (alcohols or phenols).
- Unit 5. Chloro substitution products (and their relatives) of carbonyl compounds (aldehydes, ketones, quinones, aldehyde polymers, acetals, alcoholates, etc.).
- Unit 6. Chloro substitution products of carboxylic acids and anhydrides.
- Unit 7. Acyl chlorides.
- Unit 8. Chlorine substitution products of ethers and of esters.

Compounds of the last five units containing more than one functional group are also listed under such of the others as may be appropriate. For example, 2,5-dichloro-3,6-dihydroxybenzoquinone-1,4 is listed both as a

carbonyl compound (Unit 6) and as a phenol (Unit 4); diethylene glycol mono(chloroacetate) is listed not only as an ester (Unit 8) but also as an alcohol (Unit 4) and an ether (Unit 8).

It may be of interest to summarize briefly the distribution of the compounds in this book among the several classes as shown in the following summary:

Unit 1	221	Unit 5	146
Unit 2	182	Unit 6	137
Unit 3	174	Unit 7	142
Unit 4	211	Unit 8	182

The total number of such unit listings (1395) thus exceeds the number of individual compounds (1320) by an amount representing the cases of multiple functions.

### *E. Alphabetical Index*

This conventional type of index includes not only the "principal" name, but also all the subsidiary names given in the *Tables* for every numbered compound in this book. It cannot, of course, guarantee to contain every name which might conceivably be applied since, for the field of chemistry, such names are legion. However, with every name that is listed is associated the corresponding location (or serial) number, so that use of this index is perfectly straightforward and the index requires no cross referencing within itself. The first letter of the first syllable of the name proper establishes its position in the alphabetical sequence irrespective of any literal or numerical prefixes such as *o-*, *m-*, *p-*, *sec-*, *ter-*, *cis-*, *trans-*,  $\alpha$ -,  $\beta$ -,  $\gamma$ -,  $\delta$ -, *d-*, *l-*, *meso-*. Within a particular group of isomers with the same name, however, the sequence is *o-*, *m-*, *p-*; *sec-*, *ter-*; or  $\alpha$ -,  $\beta$ -,  $\gamma$ -,  $\delta$ -, etc. *Iso* is not construed as a prefix but as part of the main root. Further details of this sort are given in the introduction to the index itself.

## CHAPTER II

### DIVISION A. SOLIDS

(3:0000-3:0499)

— PENTACHLOROACETONE  $\text{Cl}_2\text{CH}-\text{C}(\text{Cl})_2-\text{COCl}$   $\text{C}_2\text{HOC}_2\text{Cl}_5$  Beil. I - 656

	86-87°	at 2 mm. (3)			

Care should be taken to avoid confusion of  $\bar{C}$  with the acid chloride of cinnamic acid; the acid chloride is properly designated as cinnamoyl chloride (3:0330); furthermore note that some of the older publications designate  $\bar{C}$  as "styryl chloride," which is now incorrect since in current usage the name *styryl* is reserved for the radical  $\text{C}_6\text{H}_5\text{CH}=\text{CH}-$  derived from styrene (14).

Attention is also taken to the fact (not fully recognized in the older work) that in some (but not all) reactions of  $\bar{C}$  the prods. obtained may in part be derived from the symionic mesomer of  $\bar{C}$ , viz., phenyl-vinyl-carbinyl chloride (3-chloro-3-phenylpropene-1); for examples see below.

$\bar{C}$  when pure is colorless oil with no odor of HCl; if HCl is present  $\bar{C}$  soon darkens on stdg. —  $\bar{C}$  should leave no residue on distillation, and best yields of  $\text{RMgCl}$  (see below) are obtainable only with freshly distilled  $\bar{C}$  (3).

[For prepn. of  $\bar{C}$  from cinnamyl alc. (1:5920) with HCl gas at 0° (yields: 92-93% (1), 78% (7), 60% (12)) (5) (6) (15), with HCl gas in  $\text{CCl}_4$  soln. at room temp. (85% yield (7)), with 6-7 wt. pts. 6 N HCl on distn. (79% yield (4)), or with conc. HCl +  $\text{ZnCl}_2$  in  $\text{C}_6\text{H}_6$  (54% yield (16) see indic. refs.; from cinnamyl alc. (1:5920) with  $\text{PCl}_3$  in  $\text{C}_6\text{H}_6$  (62.5% yield (1)), or  $\text{PCl}_3$  +  $\text{ZnCl}_2$  in  $\text{C}_6\text{H}_6$  (65% (16)) (note that  $\text{PCl}_5$  +  $\text{ZnCl}_2$  in  $\text{C}_6\text{H}_6$  gave only tar (16)); from cinnamyl alc. (1:5920) with  $\text{SOCl}_2$  + pyridine in  $\text{CHCl}_3$  (yields: 83% (3), 69-75% (12)), with  $\text{SOCl}_2$  + diethylaniline (18) or other tertiary bases (18), or with excess  $\text{SOCl}_2$  in  $\text{C}_6\text{H}_6$  (72% yield (16)) see indic. refs.; from cinnamyl ethers by cleavage with HCl (22° B<sub>6</sub>) on htg. under press. see (8); from cinnamyl acetate (see below) by passing in dry HCl see (18).]

[For prepn. of  $\bar{C}$  from phenyl-vinyl-carbinol [Beil. VI-572, VI<sub>1</sub>-(283)] (7) with HCl gas (7) (10) or with *p*-nitrobenzoyl chloride in ether on htg. in s.t. (10); from phenyl-vinyl-carbinyl acetate with HCl gas see (19).]

$\bar{C}$  with  $\text{Br}_2$  (1 mole) adds 2 atoms halogen yielding (20) (6) (10)  $\alpha,\beta$ -dibromo- $\gamma$ -chloro-*n*-propylbenzene, thls. from ether, m.p. 104-105° (6) (10).

$\bar{C}$  with conc. HI ( $D = 1.7$ ) (3 wt. pts.) in AcOH (7) or  $\bar{C}$  with KI in dry acetone (11) gives in good yield (7) cinnamyl iodide, pale yel. lfts., which after very careful recrystn. from AcOH have m.p. 57° (7); note, however, that the substance is very unstable, cf. (7) (11).

[ $\bar{C}$  on htg. with salts of acids yields a mixt. of the corresp. esters of cinnamyl alcohol (1:5920) and phenyl-vinyl-carbinol, the proportions of which vary with the nature of the acid radical, the metal, solvent, etc.; for extensive study of the reaction see (19) (7).] — [For behavior of  $\bar{C}$  with ethyl sodioacetoacetate (21), Ag salt of 3-hydroxynaphthoquinone-1,4 (2), or with 1,5-dichloroanthrone + aq. KOH (22) see indic. refs.]

$\bar{C}$  readily hydrolyzes to the corresp. alc. (1:5920): e.g.,  $\bar{C}$  with aq. on boilg. for 1 hr. is 75% saponified (7);  $\bar{C}$  with boilg. aq. 1 *N* NaOH is 95% hydrolyzed in 1 hr. (7); note, however, that  $\bar{C}$  is remarkably stable toward strong aq. alk. in cold (e.g., with 3.5 vols. 53% aq. NaOH only trace of hydrolysis even after 8 hrs. shaking (7)); note also that the cinnamyl alc. (1:5920) obtd. by hydrol. is contaminated with di-cinnamyl ether, h.p. 231–232°, and probably also by the ether from phenyl-vinyl-carbinol. —  $\bar{C}$  (10 g.) with excess cold dil. aq.  $\text{Na}_2\text{CO}_3$  on shaking 85 hrs. gives phenyl-vinyl-carbinol (1.3 g.) + cinnamyl alc. (1:5920) (0.7 g.), di-cinnamyl ether (2.6 g.) + unhydrolyzed chlorides (4.1 g.) (7).

[ $\bar{C}$  with abs. alc. KOH yields only (7) cinnamyl ethyl ether; note, however, that the course of the reaction is modified by pres. of aq. and that  $\bar{C}$  with NaOH in 70% aq. alc. the cinnamyl ethyl ether is accompanied by 25–30% of ethyl phenyl-vinyl-carbinyl ether (7); furthermore  $\bar{C}$  with silver oxide in abs. alc. (thus even in absence of aq.) gives both ethers (7) (for numerous details see (7)).]

[The behavior of  $\bar{C}$  with  $\text{NH}_3$  (or amines) is doubtless similarly influenced by the environment but has been less thoroughly studied. —  $\bar{C}$  in ether with large excess conc. aq.  $\text{NH}_4\text{OK}$  on stdg. gives (77% yield (23)) tetracinnamylammonium chloride, ndls. from alc., m.p. 199° (23);  $\bar{C}$  with abs. alc.  $\text{NH}_3$  gives (24) (25) (5) mono-, di- and tri-cinnamylamines.]

$\bar{C}$  with tertiary amines forms quaternary salts. e.g.,  $\bar{C}$  with  $\text{Me}_3\text{N}$  in abs. EtOH 24 hrs. at room temp. gives (26) (25) cinnamyl-trimethyl-ammonium chloride, very hygroscopic solid (for derivatives see (25) (26)); for quaternary salt formn. of  $\bar{C}$  with dimethylaniline (15) or pyridine (6) (5) see indic. refs.

[ $\bar{C}$  (1 mole) with aniline (4 moles) in ether as directed gives (50% yield (27)) *N*-(cinnamyl)-aniline, m.p. 21°, h.p. 200–202° at 12 mm., 178° at 3 mm. (27);  $\bar{C}$  (1 mole) with hexamethylenetetramine (1 mole) in aq. alc. as directed gives (20–30% yield (8)) cinnamaldehyde (1:0245).]

$\bar{C}$  (freshly distilled) with Mg in dry ether under special conditions gives (83% yield (31) (12)  $\text{RMgCl}$ : note carefully, however, that this Grignard is (or behaves as) a mixture consisting of 27% cinnamyl  $\text{MgCl}$ ,  $\text{C}_6\text{H}_5\text{—CH=CH.CH}_2\text{MgCl}$ , accompanied by 73% pheoyl-vinyl-carbinyl  $\text{MgCl}$ ,  $\text{C}_6\text{H}_5\text{—C(MgCl).CH=CH}_2$  (12).

[The reactns. of the Grignard mixture thus obtd. from  $\bar{C}$  therefore generally yield prods. corresponding to both the components sometimes accompanied by material originating from coupling reactns. of  $\text{RMgCl}$  (either or both types) with itself: e.g.,  $\text{RMgCl}$  (designating the above mixture) on acid hydrolysis with 3 *N*  $\text{H}_2\text{SO}_4$  gives not only both propenylbenzene [Beil. V-481,  $V_1$ -(231),  $V_2$ -(371)], b.p. 176°, and allylbenzene [Beil. V-484,  $V_1$ -(233),  $V_2$ -(373)], h.p. 156° (from the two  $\text{RMgCl}$  types) (combined yield 47% (12)), but also a high-boilg. residue (81% yield (12)) (from coupling of  $\text{RMgCl}$ , see below).]

[ $\bar{C}$  (2 moles) with Mg (1 atom wt.) in dry ether subsequently hydrolyzed gives a high-boilg. fracta. consisting of a solid and a liquid hydrocarbon: the solid hydrocarbon (8–9% yield (28)) (1) is 1,6-diphenylhexadiene-1,5 (dicinnamyl) [Beil.  $V_1$ -(338),  $V_2$ -(597)], lfts. from alc. or AcOH, m.p. 82° (1), 81–82° (29), h.p. 211° at 11 mm. (1), 180° at 5 mm. (29); the liquid hydrocarbon (42.9% yield (28)) has now been recognized (28) (contrary to earlier views (1)) as 1,4-diphenylhexadiene-1,5, b.p. 157–160° at 2 mm.,  $D_{20}^{20} = 0.9919$ ,  $n_D^{20} = 1.5890$  (28). — For mode of formation of these prods. see (28).]

[ $\bar{C}$  converted to  $\text{RMgCl}$  (see above) and reacted with  $\text{NH}_2\text{Cl}$  at  $-20^\circ$  gives (14% yield (33)) cinnamylamine.]

⑤ Phenyl-vinyl-acetic acid: cryst. from pet. ether at  $-10^{\circ}$ , m.p.  $23-24^{\circ}$  {30}. [From RMgCl with  $\text{CO}_2$  (note that ord. method gives low yields (38% {3} cf. {17}) but simple modification of carbonation technique raises yield to 62-66% {3}).] — This acid on htg. or on warming with either alk. or acid isomerizes (by change in position of double bond) to  $\alpha$ -phenylcrotonic acid (methylatropic acid) [Beil. IX-615] (see also next paragraph).

—  $\alpha$ -Phenylcrotonic acid (methylatropic acid): pr. from alc., ndls. or lfts. from aq., m.p.  $135-136^{\circ}$  {17} (*p*-nitrobenzyl ester, m.p.  $80-81^{\circ}$  {31}) (see also preceding paragraph). [From RMgCl (above) with ethyl chloroformate (3:7295) followed by hydrolysis of the intermediate ethyl phenyl-vinyl-acetate by htg. with 20% HCl or by shaking for 2 days with alkali (the hydrolysis being accompanied by simultaneous rearr. of the unsatd. linkage) {30}.]

⑥ Phenyl-vinyl-acetic anilide: cryst. from  $\text{C}_6\text{H}_6$ , alc., or  $\text{CHCl}_3$ , m.p.  $97-98^{\circ}$  {30}. [From RMgCl (above) with phenyl isocyanate in dry ether {30}; this prod. may be accompanied by a small amt. of  $\alpha$ -phenylcrotonanilide, m.p.  $192^{\circ}$ , from partial isomerization during the reactn. {30}.]

⑦ *N*-(Cinnamyl)phthalimide: cryst. from 90% alc. or 90% AcOH {24} or from *n*-PrOH {32}, m.p.  $156^{\circ}$  {32},  $153^{\circ}$  {24}. [From  $\bar{\text{C}}$  with K phthalimide by htg. at  $160^{\circ}$  for several hrs. {24}; note that the structure of this prod. has been confirmed as the cinnamyl (and not the phenyl-vinyl-carbinyl) type {32}.]

$\bar{\text{C}}$  on distn. with fused NaOH loses HCl giving two products regarded (2) as decamethylene oxide and decen-1-ol, but their structures have been questioned (3)]

$\bar{\text{C}}$  with thiophenol in aq. NaOH, heated 3 hrs., yields (1) 10-hydroxy-*n*-decyl phenyl sulfide, ndls. from lt. pet., m p. 66.5° (1); this prod. with  $\text{SOCl}_2$  gives 10-chloro-*n*-decyl phenyl sulfide, cryst. from alc., m p. 27.5° (1)

$\bar{\text{C}}$  with morpholine gives (5) alm. quant. 10-(4-morpholinyl)decanol-1, m p. 39.5-40.5°, b.p. 164.0-165.0° at 2 mm (corresp. *N*-( $\alpha$ -naphthyl)carbamate, m p. 66.5-67.5° cor. (5)).

—  $\bar{\text{C}}$  (1 mole) with *N*-phenylpiperazine (2 moles) at 100° for 5 hrs. gives (5) in alm. 100%

formn. of  $\bar{C}$  from cetyl alc. +  $PCl_5$  (in pres. of mesityl oxide +  $Ac_2O$ ) (61.5% yield) see (10). — For formn. of  $\bar{C}$  from cetyl nle. with  $PCl_5$  see (5), but note that prod. always conts. unchanged cetyl alc. (1:5945) and cetene-1 (1:7000) (12) cf. (2).]

[For prepn. of  $\bar{C}$  from cetyl stearate (1:2193) with dry  $HCl$  gas (97% yield (11)), from cetyl acetate (1:2038) with dry  $HCl$  gas +  $ZnCl_2$  at  $180^\circ$  (13) see indic. refs.]

[For formn. of  $\bar{C}$  from a mixt. of  $K$  palmitate +  $K$  chloroacetate by electrolysis see (8).]

## PHYSICAL BEHAVIOR OF $\bar{C}$

[For study of electrophoretic mobility of emulsions of  $\bar{C}$  see (14).]

## CHEMICAL BEHAVIOR OF $\bar{C}$

### WITH INORGANIC REACTANTS

With metals. [ $\bar{C}$  with  $Li$  in dry ether under  $N_2$  gives (100% yield (15))  $C_{16}H_{33}Li$ ; on carbonation of mixt. with  $CO_2$  this is converted (51% yield (15)) to *n*-heptadecanoic acid (margaric acid) (1:0635): note, however, that  $\bar{C}$  with  $Li$  in pct. eth. (b.p.  $30-35^\circ$ ) gives (15) only 63% yield  $C_{16}H_{33}Li$  and this on carbonation only 27% overall yield of margaric acid accompanied by other prods. — For analogous reacts. of  $\bar{C}$  with  $Na$  see (15) (16); for react. of  $\bar{C}$  with  $Ca$  in dry ether under  $N_2$  see (15).]

$\bar{C}$  with  $Mg$  in dry ether + trace  $I_2$  gives in 6 hrs. (96% yield (1))  $C_{16}H_{33}MgCl$ .

With  $NH_3$ . [ $\bar{C}$  with liq.  $NH_3$  in alc. in s.t. at  $170^\circ$  for 24 hrs. gives (70% yield (17)) di-*n*-hexadecylamine, cryst. from alc., m.p.  $65^\circ$ , b.p.  $220^\circ$  at 3 mm. (17), accompanied by (24% yield (17)) *n*-hexadecylamine, m.p.  $45^\circ$ , b.p.  $146-148^\circ$  at 3 mm. ( $\bar{B}.HCl$ , lfts. from abs. alc., m.p.  $178^\circ$  (17)).]

With misc. inorg. reactants. [ $\bar{C}$  over spec. prepd.  $Al_2O_3$  at  $250^\circ$  loses  $HCl$  giving (94% yield (18)) of a mixt. of hexadecenes together with other prods.]

[ $\bar{C}$  with  $KOH$  at  $200-300^\circ$  gives (19) palmitic acid (1:0650);  $\bar{C}$  with alc.  $KSH$  gives (21) *n*-hexadecyl mercaptan;  $\bar{C}$  with nle.  $K_2S$  gives (21) di-*n*-hexadecyl sulfide.]

[ $\bar{C}$  with  $Na_2SO_3 \cdot 7H_2O$  (6 moles) at  $190-200^\circ$  for 8 hrs. under press. gives (98% yield (20)) sodium cetanesulfonate-1.]

[For study of rate of reactn. of  $\bar{C}$  with  $KI$  in acetone at  $50^\circ$  and  $60^\circ$  see (3).]

### WITH ORGANIC REACTANTS

[ $\bar{C}$  with nle.  $KOH$  gives (5) ethyl *n*-hexadecyl ether, f.p.  $19.9^\circ$  (5);  $\bar{C}$  with sodium allyl oxide refluxed 30 hrs. gives (70% yield (22)) allyl *n*-hexadecyl ether, pl. from aq. alc., m.p.  $25^\circ$  (22).]

[ $\bar{C}$  (1 mole) with 33% nle.  $MeNH_2$  (1 mole) in s.t. at  $140-150^\circ$  for 18 hrs. gives (68% yield (17)) *N*-methyl-di-*n*-hexadecylamine, ndls. from alc., m.p.  $36-37^\circ$ , b.p.  $269-271^\circ$  at 1 mm. (17) accompanied by (15% yield (17)) *N*-methyl-*n*-hexadecylamine, b.p.  $147-150^\circ$  at 1 mm. ( $\bar{B}.HCl$ , m.p.  $169-170^\circ$  (17)). —  $\bar{C}$  (1 mole) with  $Me_2NH$  (2 moles) in alc. in s.t. at  $140^\circ$  for 14 hrs. gives (82.5% yield (17)) *N,N*-dimethyl-*n*-hexadecylamine, b.p.  $158^\circ$  at 3 mm. ( $\bar{B}.HCl$ , lfts. from  $AcOEt$ /dioxane 5/1, m.p.  $198^\circ$  (17)).]

$\bar{C}$  with tertiary amines gives by addn. the corresp. quaternary ammonium salts [e.g.,  $\bar{C}$  with  $Me_3N$  (2 moles) in alc. in s.t. at  $100-105^\circ$  for 12-16 hrs. (17), or  $\bar{C}$  with  $Me_3N$  (1 mole) in closed bottle at  $110^\circ$  for 5 hrs. (7), gives (100% yield (17)) trimethyl-*n*-hexadecylammonium chloride, hygroscopic lfts. from  $AcOEt$ /alc., m.p. abt.  $70^\circ$  (17); for study of surface tension of aq. solns. of this salt see (7)].

$\bar{C}$  with pyridine (1 mole) in s.t. at  $110^\circ$  for 15 hrs. (23) or at  $120^\circ$  for 8 hrs. (7) gives *n*-hexadecyl-pyridinium chloride, cryst. with 1  $H_2O$  from alc./ether or  $C_6H_6$ , m.p.  $83^\circ$  (23),  $82^\circ$  (24) [for study of surface tension (7), conductivity (24), and elec. potential (24) of aq.

solns. of this salt see indic. refs.; for cat. hydrogenation of this salt to *N*-(*n*-hexadecyl) piperidine.HCl, m.p. 180° see (23); for study of favorable effect of press. on reactn. of  $\bar{C}$  with pyridine see (12)].

[For analogous reactn. of  $\bar{C}$  with *N,N*-dimethyl-benzylamine (17) or with isoquinoline (23) see indic. refs.]

[For reactn. of  $\bar{C}$  with  $\alpha$ -picoline + NaNH<sub>2</sub> yielding  $\alpha$ -(*n*-heptadecyl)pyridine, m.p. 23.5°, b.p. 206° at 2.5 mm.,  $\bar{B}.P.K.OH$ , m.p. 87°, or of  $\bar{C}$  with  $\gamma$ -picoline + NaNH<sub>2</sub> yielding  $\gamma$ -(*n*-heptadecyl)pyridine, m.p. 33°, b.p. 207-210° at 2.5 mm.,  $\bar{B}.P.K.OH$ , m.p. 115°, see (9)]

— *n*-Hexadecyl *p*-nitrobenzoate: m.p. 58.4° cor. (25). [Prepd. indirectly.]

— *n*-Hexadecyl 3,5-dinitrobenzoate: m.p. 66°. [Prepd. indirectly.]

— *N*-(*n*-Hexadecyl)phthalimide: unreported.

— *S*-(*n*-Hexadecyl)isothiouraea hydrochloride: m.p. 126-128° (26). [From  $\bar{C}$  with thiouraea in alc. on refluxing 3-4 days (26)]

— *n*-Hexadecyl mercuric chloride: cryst. from pet. eth. or AcOEt, m.p. 114-115° (15). [Prepd. indirectly; note that m.p. of mixts. of this prod. with either  $n-C_{12}H_{25}HgCl$  (m.p. 114-114.5°) or  $C_{18}H_{37}HgCl$  (m.p. 115-116°) is depressed (15).]

formo. of  $\bar{C}$  from cetyl alc. +  $PCl_5$  (in pres. of mesityl oxide +  $Ac_2O$ ) (61.5% yield) see (10). — For formo. of  $\bar{C}$  from cetyl alc. with  $PCl_5$  see (5), but note that prod. always conts. unchanged cetyl alc. (1:5945) and cetene-1 (1:7000) (12) cf. (2).]

[For prepn. of  $\bar{C}$  from cetyl stearate (1:2193) with dry  $HCl$  gas (97% yield (11)), from cetyl acetate (1:2038) with dry  $HCl$  gas +  $ZnCl_2$  at  $180^\circ$  (13) see indic. refs.]

[For formn. of  $\bar{C}$  from a mixt. of  $K$  palmitate +  $K$  chloroacetate by electrolysis see (8).]

## PHYSICAL BEHAVIOR OF $\bar{C}$

[For study of electrophoretic mobility of emulsions of  $\bar{C}$  see (14).]

## CHEMICAL BEHAVIOR OF $\bar{C}$

### WITH INORGANIC REACTANTS

With metals. [ $\bar{C}$  with  $Li$  in dry ether under  $N_2$  gives (100% yield (15))  $C_{16}H_{33}Li$ ; on carbonation of mixt. with  $CO_2$  this is converted (51% yield (15)) to *n*-heptadecanoic acid (margaric acid) (1:0635): note, however, that  $\bar{C}$  with  $Li$  in pet. eth. (b.p.  $30-35^\circ$ ) gives (15) only 63% yield  $C_{16}H_{33}Li$  and this on carbonation only 27% overall yield of margaric acid accompanied by other prods. — For analogous reacts. of  $\bar{C}$  with  $Na$  see (15) (16); for react. of  $\bar{C}$  with  $Ca$  in dry ether under  $N_2$  see (15).]

$\bar{C}$  with  $Mg$  in dry ether + trace  $I_2$  gives in 6 hrs. (96% yield (1))  $C_{16}H_{33}MgCl$ .

With  $NH_3$ . [ $\bar{C}$  with liq.  $NH_3$  in alc. in s.t. at  $170^\circ$  for 24 hrs. gives (70% yield (17)) di-*n*-hexadecylamine, cryst. from alc., m.p.  $65^\circ$ , b.p.  $220^\circ$  at 3 mm. (17), accompanied by (24% yield (17)) *n*-hexadecylamine, m.p.  $45^\circ$ , b.p.  $146-148^\circ$  at 3 mm. ( $\bar{B}.HCl$ , lfts. from abs. alc., m.p.  $178^\circ$  (17)).]

With misc. inorg. reactants. [ $\bar{C}$  over spec. prepd.  $Al_2O_3$  at  $250^\circ$  loses  $HCl$  giving (94% yield (18)) of a mixt. of hexadecenes together with other prods.]

[ $\bar{C}$  with  $KSH$  gives (21)

(98% yield (20))

sodium octaethylsulfonate-1.]

[For study of rate of reactn. of  $\bar{C}$  with  $KI$  in acetone at  $50^\circ$  and  $60^\circ$  see (3).]

### WITH ORGANIC REACTANTS

[ $\bar{C}$  with alc.  $KOH$  gives (5) ethyl *n*-hexadecyl ether, f.p.  $19.9^\circ$  (5);  $\bar{C}$  with sodium allyl oxide refluxed 30 hrs. gives (70% yield (22)) allyl *n*-hexadecyl ether, pl. from aq. alc., m.p.  $25^\circ$  (22).]

[ $\bar{C}$  (1 mole) with 33% alc.  $MeNH_2$  (1 mole) in s.t. at  $140-150^\circ$  for 18 hrs. gives (68% yield (17)) *N*-methyl-di-*n*-hexadecylamine, ndls. from alc., m.p.  $36-37^\circ$ , h.p.  $269-271^\circ$  at 1 mm. (17) accompanied by (15% yield (17)) *N*-methyl-*n*-hexadecylamine, h.p.  $147-150^\circ$  at 1 mm. ( $\bar{B}.HCl$ , m.p.  $169-170^\circ$  (17)). —  $\bar{C}$  (1 mole) with  $Me_2NH$  (2 moles) in alc. in s.t. at  $140^\circ$  for 14 hrs. gives (82.5% yield (17)) *N,N*-dimethyl-*n*-hexadecylamine, b.p.  $158^\circ$  at 3 mm. ( $\bar{B}.HCl$ , lfts. from  $AcOEt$ /dioxane 5/1, m.p.  $198^\circ$  (17)).]

$\bar{C}$  with tertiary amines gives by addn. the corresp. quaternary ammonium salts [e.g.,  $\bar{C}$  with  $Me_3N$  (2 moles) in alc. in s.t. at  $100-105^\circ$  for 12-16 hrs. (17), or  $\bar{C}$  with  $Me_3N$  (1 mole) in closed hottle at  $110^\circ$  for 5 hrs. (7), gives (100% yield (17)) trimethyl-*n*-hexadecylammonium chloride, hygroscopic lfts. from  $AcOEt$ /alc., m.p. aht.  $70^\circ$  (17); for study of surface tension of aq. solns. of this salt see (7)].

$\bar{C}$  with pyridine (1 mole) in s.t. at  $110^\circ$  for 15 hrs. (23) or at  $120^\circ$  for 8 hrs. (7) gives *n*-hexadecyl-pyridinium chloride, cryst. with 1  $H_2O$  from alc./ether or  $C_6H_6$ , m.p.  $83^\circ$  (23),  $82^\circ$  (24) [for study of surface tension (7), conductivity (24), and elec. potential (24) of aq.

solns. of this salt see indic. refs.; for cat. hydrogenation of this salt to *N*-(*n*-hexadecyl) piperidine.HCl, m.p. 180° see (23); for study of favorable effect of press. on reactn. of  $\bar{C}$  with pyridine see (12)].

[For analogous reactn. of  $\bar{C}$  with *N,N*-dimethyl-benzylamine (17) or with isoquinoline (23) see indic. refs.]

[For reactn. of  $\bar{C}$  with  $\alpha$ -picoline + NaNH<sub>2</sub> yielding  $\alpha$ -(*n*-heptadecyl)pyridine, m.p. 23.5°, b.p. 206° at 2.5 mm.,  $\bar{B}$ .PhOH, m.p. 87°, or of  $\bar{C}$  with  $\gamma$ -picoline + NaNH<sub>2</sub> yielding  $\gamma$ -(*n*-heptadecyl)pyridine, m.p. 33°, h.p. 207-210° at 2.5 mm.,  $\bar{B}$ .PhOH, m.p. 115°, see (9).]

— *n*-Hexadecyl *p*-nitrobenzoate: m.p. 58.4° cor. (25) [Prepd. indirectly.]

— *n*-Hexadecyl 3,5-dinitrobenzoate: m.p. 66° [Prepd. indirectly.]

$\bar{C}$  rapidly becomes turbid in contact with atmosphere and should be kept in sealed tubes (1). —  $\bar{C}$  on attempted distn. at ord. press. loses HCl and gives 1,1,2,2-tetraphenylethane [Beil. V-739, VI-(371)] (20), m p. 211°, and 1,1,2,2-tetraphenylethylene [Beil V-743, VI-(376)] (9), m.p. 227°.

[For prepn. of  $\bar{C}$  from diphenylcarbinol (1:5960) with dry HCl gas alone (9) (21), or in  $C_6H_6$  (92% yield (14)), or in  $C_6H_6 + CaCl_2$  (yield: 90% (1), 85% (3)) (11) (17), with  $SOCl_2$  in toluene (93.3% yield (2)), with  $PCl_5$  in  $POCl_3$  (92% yield (14)), or with  $BeCl_2$  (77% yield (8)) see indic. refs.; from diphenylmethane (1:7120) with  $PCl_5$  at 170° (together with other products) (22) or with  $NOCl$  (together with other products) (23) see indic. refs.: for formn. of  $\bar{C}$  from diphenylcarbinyl MgBr with  $C_6H_5N$  (42% yield + 8% diphenylacetone-trile + 5% 1,1,2,2-tetraphenylethane) see (10); from *bis*-(diphenylcarbinyl) ether in  $C_6H_6$  with HCl gas (77% yield) see (1); from diphenylcarbinylhydrazine with hoilg. dil. HCl see (24); from diphenyldiazomethane with HCl gas in ether at -80° see (25)]

[ $\bar{C}$  with molecular Ag in  $C_6H_6$  in absence of  $O_2$  gives 100% yield (19) of 1,1,2,2-tetraphenylethane (see first paragraph); in pres. of pure  $O_2$  yield drops to 2-8% and other products are formed (19);  $\bar{C}$  in  $C_6H_6$  refluxed some hours with Na gives (80-90% yield (14)) (9) (21) 1,1,2,2-tetraphenylethane (see first paragraph);  $\bar{C}$  with Na in liq.  $NH_3$  gives (26) 1,1,2,2-tetraphenylethane (65% yield) + diphenylmethane (1:7120) (27% yield).]

$\bar{C}$  in dry ether treated with Mg + trace of  $I_2$  immediately ppts. 1,1,2,2-tetraphenylethane whose yield may reach 95.5% (2); however, under special conditions (6)  $\bar{C}$  in ether with Mg + trace of  $I_2$  gives (51-71%) corresp.  $RMgCl$  cpd.; this prod. upon treatment with  $CO_2$  gives (yield: 84% (6), 32.5% (2)) diphenylacetic acid (1:0765), m p. 148°; the  $RMgCl$  cpd. does not react (2), however, with phenyl isocyanate.

[ $\bar{C}$  with pure  $AlCl_3$  immediately resinifies (11); however,  $\bar{C}$  in  $C_6H_6$  with  $AlCl_3$  gives (11) triphenyl-chloromethane (3:3410) + diphenylmethane (1:7120) with a very little triphenylmethane (1:7220).]

[ $\bar{C}$  htd. with 20% aq.  $Na_2SO_3$  soln. for 3 hrs. at 120° gives (100% yield (28)) (27) *bis*-(diphenylmethyl) ether [Beil. VI-679, VI-(326)], cryst. from alc., m p. 109° (27), 110° (17); note that this reaction probably results from intermediate diphenylcarbinol and that none of the expected sulfonate can be isolated.]

[For reactn. of  $\bar{C}$  with phenols +  $ZnCl_2$  yielding mono-, di- or tri-alkylated phenols according to conditions see (13) (29) cf. (30); for reactn. of  $\bar{C}$  with thiophenols see (31); for reactn. of  $\bar{C}$  with excess  $Br.Mg.C \equiv C.MgBr$  giving (40-50% yield) 1,1,4,4-tetraphenylbutine see (32); for reactn. of  $\bar{C}$  with anthrone +  $KOH$  see (33).]

$\bar{C}$  with aq. hydrolyzes yielding diphenylcarbinol (1:5960) or its reactn. products according to particular conditions; for extensive studies see (34) (12) (35) (18) (40) (35). —  $\bar{C}$  with EtOH undergoes alcoholysis yielding ethyl diphenylcarbinyl ether + HCl (for very extensive studies of this and related reactions see (1) (36) (4) (17) (37) (7) (35). —  $\bar{C}$  after warming with alc. may then be titrated quant. with stand. alkali using phenolphthalein (1).

— Diphenylcarbinyl acetate [Beil. VI-680, VI-(326)]; cryst. from AcOH, m p. 40-41°.

[From  $\bar{C}$  with KOAc in AcOH (22).]

[See also *cis*-2-chlorocyclohexanol-1 (3:9374).]

Both the two theoretically possible geometrical stereoisomers of 2-chlorocyclohexanol-1 are known. The single form obtained from cyclohexene (tetrahydrobenzene) by addn. of HOCl or from cyclohexene oxide by addn. of HCl is now regarded (3) as the *trans* isomer  $\bar{C}$ . The *cis* form (3:9374) is obt'd. by other methods.

Colorless pr. from mixt. of  $C_6H_6$  + lgr. at low temp.;  $\bar{C}$  has characteristic odor, is vol. with steam.

[For prepn. of  $\bar{C}$  from cyclohexene (tetrahydrobenzene) (1:8070) with HOCl (yields: 70–73% (4), 70% (5)) (6) (7) (8) or with *N*-chlorourea (yield: 74% (26), 54% (9)) see indic. refs.; from cyclohexene oxide (see below) with conc. HCl or with  $ZnCl_2$  in dry ether see (3); for probable formn. of  $\bar{C}$  from cyclohexene (1:8070) with EtOCl (3:7022) see (10); for formn. of a mixt. of both stereoisomeric 2-chlorocyclohexanols contg. 27–28%  $\bar{C}$  + 72–73% *cis*-isomer from 2-chlorocyclohexanone (3:0120) by reductn. with isopropyl MgCl, *ter*-butyl MgX, or cyclohexyl MgX see (3); for formn. of a mixt. (b.p. 78–80° at 12 mm.) of both isomers by hydrolysis of 2-chlorocyclohexanyl acetate see (11).]

$\bar{C}$  with aq. NaOH at room temp. gives (yields. 70–73% (12), 70–75% (5), 80% (9), 55% (13)) cyclohexene oxide (1,2-epoxycyclohexane) [Beil. XVII-21], b.p. 131.5° at 760 mm. [Note that reactn. of  $\bar{C}$  with alk. is 300 times as fast as that of the *cis* isomer (3:9374) (use in detn. of proportion of  $\bar{C}$  in mixts. of isomers), that the latter with alk. gives no epoxy cpd. but instead cyclohexanone, and finally that  $\bar{C}$  can be separated from its isomer by conversion to cyclohexene oxide from which the remaining *cis* isomer can be sep'd. by distn. (3).]

$\bar{C}$  with alk. or with aq. KCl is *not* converted to *cis* isomer (3) but  $\bar{C}$  on protracted htg. with HCl rearr. to a small extent to the *cis* isomer.

[For use of  $\bar{C}$  as seed disinfectant see (15).]

The halogen atom of  $\bar{C}$  is fairly reactive, but its replacement often involves rearr. of the cyclohexyl ring to a cyclopentyl ring.

$\bar{C}$  on hoilg. with dil. alc. slowly gives (1) *trans*-cyclohexanediol-1,2 [Beil. VI-740] with cyclopentylformaldehyde (formylcyclopentane), the latter increasing in pres. of dil.  $H_2SO_4$  or of  $CaCl_2$  (1).]

$\bar{C}$  with NaOMe in MeOH yields (14) *cis*-2-methoxycyclohexanol-1 [Beil. VI-740], b.p. 181.5° at 760 mm.,  $D_{25}^{20} = 1.015$ ,  $n_D^{20} = 1.4605$  (14);  $\bar{C}$  with NaOEt in EtOH (14) (or  $\bar{C}$  in EtOH treated with Na in attempted reductn. (16) gives (87% yield (16)) *cis*-2-ethoxycyclohexanol-1 [Beil. VI-740], b.p. 187° at 760 mm.,  $D_{25}^{20} = 0.982$ ,  $n_D^{20} = 1.4563$  (14);  $\bar{C}$  with sodium *n*-propylate yields (14) 2-*n*-propoxycyclohexanol, b.p. 205° at 760 mm.,  $D_{25}^{20} = 0.970$ ,  $n_D^{20} = 1.4580$  (14);  $\bar{C}$  with sodium cyclohexanolate yields (14) 2-cyclohexanocyclohexanol, m.p. 50° (14).]

$\bar{C}$  with  $C_6H_5CH_2MgCl$  gives (54% yield (17)) benzyl-cyclopentyl-carbinol, b.p. 166–169° at 20 mm., m.p. 30° (3,5-dinitrobenzoate, m.p. 100.5–101.5° (17)). —  $\bar{C}$  with excess MeMgI gives (50% yield (13)) mixt. of both *cis* and *trans* 2-methylcyclohexanols (1:6420). —  $\bar{C}$  with cyclohexyl MgCl (cf. 3:8040) yields (18) cyclohexyl-cyclopentyl-carbinol, m.p.

34° (*p*-nitrobenzoate, m.p. 49–50°, 3,5-dinitrobenzoate, m.p. 102°, acid phthalate, m.p. 92–93°, *N*-phenylcarbamate, m.p. 122° (18)).]

[ $\bar{C}$  with conc. aq.  $NH_4OH$  shaken for 24 hrs. (19) or  $\bar{C}$  with  $NH_3$  in alc. htd. in s.t. for 1 hr. (6) gives (yields: 71% (19), 61% (6)) *cis*-2-aminocyclohexanol [Beil. X111-348], m.p. 65° (19) (6), b.p. 110° at 24 mm. (19). —  $\bar{C}$  with diethylamine (2 moles) htd. in s.t. at 150° for several hrs. (20) (or similarly with  $BuOH$  as solvent (21)) yields 2-(diethylamino)-cyclohexanol, b.p. 225° at 740 mm. (21), 224° at 730 mm. (20),  $D_{25}^{25} = 0.9280$  (21),  $n_D^{24} = 1.4659$  (21) (hydrochloride, m.p. 170.5–171.5° (21)). —  $\bar{C}$  with 5 pts. piperazine hydrate htd. 3 hrs. at 140° gives (22) both *N,N'*-bis-(2-hydroxycyclohexyl)piperazine, m.p. 205–206° (22), and *N*-(2-hydroxycyclohexyl)piperazine, m.p. 67–68° (22) (the latter separable by treatment of mixt. with  $CS_2$  pptg. its dithiocarbamate).]

[ $\bar{C}$  also reacts as a secondary alcohol: o.g.,  $\bar{C}$  with  $PCl_5$  yields (14) 1,2-dichlorocyclohexane [Beil. V-22, V<sub>1</sub>-(8)], b.p. 187–189°,  $\bar{C}$  with  $PBr_3$  yields (14) 1-bromo-2-chlorocyclohexane, b.p. 94° at 17 mm.,  $D_{20}^{20} = 1.514$ ,  $n_D^{20} = 1.5481$  (14).]

$\bar{C}$  on oxidn. with  $K_2Cr_2O_7/H_2SO_4/AcOH$  gives (57% yield (9)) 2-chlorocyclohexanone (3:0120).

(Note: the following derivatives are listed as *cis* on the assumption of inversion during formation.)

— *cis*(?) 2-Chlorocyclohexanyl acetate: oil with odor like  $EtOAc$ , b.p. 95–96° at 11 mm. (23), 99–101° at 13 mm. (24),  $D_{15}^{25} = 1.1182$  (23),  $n_D^{25} = 1.46195$  (23). [From  $\bar{C}$  with  $AcCl$  at 10–20° (23) or in  $C_6H_6$  (espec. in pres. of  $K_2CO_3$  or  $BaCO_3$ ) (70% yield (24)), or from cyclohexene (1:8070) with  $Ac_2O$  or with  $Ac_2O + SO_2Cl_2$  in  $CHCl_3$  (11).] [This ester with  $MeOH$  + dry  $HCl$  gas yields  $\bar{C}$  (11). Cf. (25).]

— *cis*(?) 2-Chlorocyclohexanyl benzoate: lfts. from dil. alc., m.p. 120–121° (24). [From  $\bar{C}$  with  $BzCl$  htd. 10 hrs. (70% yield) (24).]

— *cis*(?) 2-Chlorocyclohexanyl *p*-nitrobenzoate: cryst. from dil. alc., m.p. 240° dec. (24). [From  $\bar{C}$  with *p*-nitrobenzoyl chloride in dry ether or  $C_6H_6 + Na_2CO_3$  refluxed 5 hrs. (70% yield) (24).]

— *cis*(?) 2-Chlorocyclohexanyl *N*-phenylcarbamate: m.p. 97–98° (2), 94–96° (17). [From  $\bar{C}$  with phenyl isocyanate in lt. pct. (17).]

— *cis*(?) 2-Chlorocyclohexanyl *N*-( $\alpha$ -naphthyl)carbamate: m.p. 165° (3). [From  $\bar{C}$  with  $\alpha$ -naphthyl isocyanate at 100° for 4 hrs. (3).]

$\bar{C}$  has large mol. freezing-point lowering, viz., 120° (6). [For use in detn. of mol. wt. of org. compds. by f.p. lowering see (6).]

$\bar{C}$  on hgt. especially in presence of catalysts such as  $\text{ZnCl}_2$  yields  $\text{HCl} + \text{hexachloropropene}$  (3:6370); with  $\text{CuCl}$  a second reaction also occurs yielding  $\text{HCl}$  and tetrachloroethylene (3:5460). [For extensive study of these see (7) (8).]

$\bar{C}$  in alc. on titration with alk. gives (4) (3) an apparent  $N_{\text{cut}}$  Eq. of 285.5 because of loss of 1  $\text{HCl}$  and formation of hexachloropropene (3:6370).

Cryst. from alc.,  $\text{AcOH}$  or lgr. — Eas. sol. warm but less so cold alc., very eas. sol. ether,  $\text{AcOH}$ ,  $\text{C}_6\text{H}_6$ ,  $\text{CS}_2$ . — Sublimes at ord. temp. — At b.p. under ord. press. tends to decompose (7). —  $\bar{C}$  has agreeable arom. odor, but strongly attacks mucous membrane (2).

[For prepn. of  $\bar{C}$  from benzyl chloride (3:8535) with  $Cl_2$  in pres. of  $I_2$  (11) (8) (15) or  $SbCl_5$  (16) see indic. refs.; from *p*-chlorotoluene (3:8287) with  $SO_2Cl_2 + Bz_2O_2$  in dark (70% yield) (35), with  $Cl_2$  in light (2) (17) (11) (5) (4) (18) (19) or with  $PhCl_4 \cdot 2NH_4Cl$  (9) see indic. refs.; from toluene with  $Cl_2$  see (20); for prepn. of  $\bar{C}$  from chlorobenzene (3:7903) with  $CH_2O + HCl$  (36), with bis-(chloromethyl) ether (3:5245) or chloromethyl methyl ether (3:7085) (formed by use of formaldehyde or paraformaldehyde + chlorosulfonic acid + conc.  $H_2SO_4$  or hexamethylenetetramine + conc.  $HCl$  (3)) as directed (50% yield (3)) (1) see indic. refs.]

$\bar{C}$  with phenol in toluene yields (21) 2-(*p*-chlorobenzyl)phenol, m.p. 60–61°, and *p*-chlorobenzyl phenyl ether, m.p. 85.5–86.5°;  $\bar{C}$  with 2,4-dichlorophenol in toluene yields (21) 2-(*p*-chlorobenzyl)-4,6-dichlorophenol, m.p. 69.5–70.5°, and *p*-chlorobenzyl 2,4-dichlorophenyl ether, m.p. 64.5–65.5°.]

$\bar{C}$  with phenol +  $AlCl_3$  yields (21) 4-(*p*-chlorobenzyl)phenol, m.p. 87–87.5° (benzoate, m.p. 115–116°);  $\bar{C}$  with 2,6-dichlorophenol +  $AlCl_3$  yields (21) 4-(*p*-chlorobenzyl)-2,6-dichlorophenol, m.p. 61.5–62.5° (benzoate, m.p. 116–117°).]

[For condens. of  $\bar{C}$  with *p*-chlorophenol (3:0475) and use of prod. as anti-moth prepn. see (22); for condens. of  $\bar{C}$  with *o*-cresol (1:1400) or its Na salt or with 3,5-dimethylphenol (*sym*-*m*-xylenol) (1:1455) and use of products as bactericides see (23); for condens. of  $\bar{C}$  with sulfonated phenol and use as tanning agent see (24); for condens. of  $\bar{C}$  with resorcinol (1:1530) +  $AlCl_3$  in nitrobenzene yielding 55% 4-(*p*-chlorobenzyl)resorcinol see (25).]

$\bar{C}$  with Mg in dry ether yields (10) *p*- $Cl.C_6H_4.CH_2$  MgCl which with phenyl isocyanate as directed (10) gives *p*-chlorophenylacetanilide [Beil. XII-275], lfts. from alc., m.p. 168° cor. (26), 165–166° u.c. (10), 164.5° (27)

$\bar{C}$  on boilg. with aq. (2) (3) hydrolyzes to *p*-chlorobenzyl alc. [Beil. VI-444], m.p. 70–71° (3) (for rate see (7));  $\bar{C}$  on boilg. with  $Ph(NO_2)_2$  for 2 days (28) or on boilg. in 60% alc. with hexamethylenetetramine (29) yields *p*-chlorobenzaldehyde (3:0765), m.p. 46–47° (3).

$\bar{C}$  with alc. KOH yields (30) *p*-chlorobenzyl ethyl ether [Beil. VI-444, VI<sub>1</sub>-(222)], oil, b.p. 225° (for study of rate of reactn. see (31));  $\bar{C}$  with KOAc in abs. alc. yields (28) *p*-chlorobenzyl acetate [Beil. VI-445], b.p. 240° (28);  $\bar{C}$  with boilg. alc. KCN yields (11) (28) (20) *p*-chlorobenzyl cyanide [Beil. LX-448], m.p. 30° (20), h.p. 265–267° (20), which on hydrolysis yields *p*-chlorophenylacetic acid (3:3135), m.p. 105° (20).

$\bar{C}$  with KI in alc. gives alm. quant. yield (17) *p*-chlorobenzyl iodide, m.p. 64° (17) (for study of rate of reactn. of  $\bar{C}$  with NaI (34) or KI (14) (6) in acetone see indic. refs.);  $\bar{C}$  with  $Na_2SO_3$  yields (18) (13) sodium *p*-chlorotoluene-*o*-sulfonate (corresp. sulfonamide, m.p. 157° (18), corresp. sulfonanilide, m.p. 235° (18)).

$\bar{C}$  with thiourea (1 mole) in alc. refluxed 30 min. gives (37) *S*-(*p*-chlorobenzyl)isothiurea hydrochloride (*p*-chlorobenzyl isothiuronium chloride), cryst. from 1:1 conc.  $HCl + aq.$ , m.p. 197°; this prod. is useful in identification of organic acids (37) ]

$\bar{C}$  on oxidn. with  $CrO_3$  (11) (3) or with  $KMnO_4$  (1) (12) yields *p*-chlorobenzoic acid (3:4940), m.p. 236°.

3:0255 *m*-CHLOROPHENOL $C_6H_5OCl$ 
 Beil. VI - 185  
 VI<sub>1</sub>-(99)  
 VI<sub>2</sub>-(172)

M.P. 32.8° (1)	B.P. 215.5-217.1° (7)	$D_4^{20} = 1.237$ (9)	$n_D^{20} = 1.5565$ (1)
32° (2)	216° (17)	$D_4^{25} = 1.268$ (9)	
31-32° (3)	213-216° (8)		
31° (4)	214° (6) cor. (16)		
28.5° (5)	211-212° u.c. (5)		
28° (6)	98° at 12 mm. (2)		

$\bar{C}$  has odor like phenol (for study of strength of odor in aq. soln. see (10)). —  $\bar{C}$  in pres. of aq. has unusual tendency to form supersatd. solns (11) (for temp./compn. data on soly. of  $\bar{C}$  in aq. or in  $C_6H_6$  see (11)). —  $\bar{C}$  cas. discolors in air.

[For prepn. of  $\bar{C}$  from *m*-chloroaniline [Beil. XII-602, XII<sub>1</sub>-(300)] via diazotization and subsequent reaction with aq. yields: alm. quant. (12) (13), 67% (1), 64% (8), 55% (4), 50% (14) (15) (5) (16) see indic. refs. (note that the process is sensitive to conditions and refs. indic. give valuable information on its control); for formn. of  $\bar{C}$  from *m*-dichlorobenzene (3:5960) with NaOMe in MeOH in s.t. at 180° for 30 hrs. see (17).]

$\bar{C}$  like its isomers is sol. in conc.  $Na_2CO_3$  soln. at room temp. and is reprecip. by  $CO_2$  (18). [For studies of value of ionization const. of  $\bar{C}$  in aq. or dil. MeOH or dil. EtOH see (19) (20) (6) (21) (22).]

$\bar{C}$  on fusion with KOH yields (23) resorcinol (1:1530). — [For condens. of  $\bar{C}$  with phthalic anhydride to yield 3,6-dichlorofluorane ("fluorescein chloride") [Beil. XIX-147] (impt. intermed. in prepn. of rhodamine dyes) see (12) (58).]

$\bar{C}$  conv. to dry Na salt and treated with  $CO_2$  under press. yields after acidifn. (14) 6-carboxy-3-chlorophenol (4-chloro-2-hydroxy benzoic acid) (4-chlorosalicylic acid) (3.4008), ndls. from aq., m.p. 207° (14).]

$\bar{C}$  in the Reimer-Tiemann reactn. with alk. (or better  $Ca(OH)_2 + Na_2CO_3$  (24)) and chloroform (24) or bromoform (25) yields both 6-aldehydo-3-chlorophenol (4-chlorosalicylaldehyde) (3.0960) and 4-aldehydo-3-chlorophenol (3.4250) in *o/p* ratio of 0.71 with  $CHCl_3$  (26) (25) and 0.84 with  $CHBr_3$  (25). — [The 4-aldehydo-3-chlorophenol has also been obt'd. (50% yield) from  $\bar{C}$  in  $C_6H_6$  with  $HCl + HCN + AlCl_3$  (29).]

$\bar{C}$  in aq.  $Na_2CO_3$  soln. couples with 1 equiv. of benzenediazonium chloride yielding (27) (18) 3-chloro-4-phenylazophenol, or -yel. ndls. from 25% AcOH, m.p. 95° (27), or, on expos. to  $HCl$ , or -red, m.p. 114° (27) (18);  $\bar{C}$  in aq. NaOH with 2 equivs. of benzenediazonium chloride yields (27) 3-chloro-2,4-bis(phenylazo)phenol, dark red-brn., m.p. 181°; no bis-azo epds. appear to be formed (27). — For study of coupling of  $\bar{C}$  with *p*-nitrobenzenediazonium bisulfate see (28).

$\bar{C}$  is not reduced by  $HI$  in AcOH (30); for study of replacement of  $Cl$  by  $H$  with  $H_2 + Ni$  cat. at room temp. see (31).]

$\bar{C}$  with *p*-aminophenol oxidized in alk. soln. with NaOCl yields (32) indo-chlorophenol;  $\bar{C}$  with *p*-aminodimethylaniline on oxidn. with NaOCl as directed (5) yields 3-chloro-*N,N*-dimethylindooaniline.]

[For condensation of  $\bar{C}$  with formaldehyde (33) or with benzaldehyde-*o*-sulfonic acid (34) and use of product as mothproofing agents see indic. refs.; for reactn. of  $\bar{C}$  with unsatd. halides in pres. of alk. yielding *m*-chlorophenyl allyl ethers which by rearn. yield corresp. substituted phenols used as bactericides see (35) (36).]

[For condens. of  $\bar{C}$  with malic acid (1.0450) + conc.  $H_2SO_4$  giving small yield of 7-chlorocoumarin [Beil. XVII-331] see (37); with ethyl acetoacetate (1:1710) +  $H_2SO_4$

giving small yield of 7-chloro-4-methylenumarin [Beil. XVII-336] see (37); with ethyl methylacetacetate (1:1712) +  $P_2O_5$  yielding 7-chloro-2,3-dimethylchromone [Beil. XVII-1-177] see (38).]

$\bar{C}$  with 3 moles  $Br_2$  (in aq.  $KBr$ ) gives 100% yield (39) 2,4,6-tribromo-3-chlorophenol, ndls. from dil. alc., m.p. 105–106° cor. (39) (methyl ether, m.p. 06° (39));  $\bar{C}$  in 10% aq.  $KOH$  with 4 moles  $I_2$  (in aq.  $KI$ ) gives 2,4,6-triiodo-3-chlorophenol; ndls. from boilg.  $AcOH$ , m.p. 139–140° (39).

[ $\bar{C}$  in dil.  $NaOH$  mixed with aq.  $NaNO_2$  and acidified as directed (40) gives (40% yield (40)) (43) 3-chloro-4-nitrosophenol, m.p. 133° (40), 129.6° (41); on soln. in  $Na_2CO_3$  and subsequent acidification this cpd. yields (40) (43) the isomeric 3-chlorobenzoquinone-4-monoxime, m.p. 184° dec. (40), cf. (42).]

[ $\bar{C}$  on mononitration with  $H_2SO_4$  +  $NaNO_3$  as directed (44) or  $\bar{C}$  in  $AcOH$  with fuming  $HNO_3$  at 0° (45) gives (yield: 32% (45), 22% (44)) 3-chloro-6-nitrophenol [Beil. VI-238], volatile with steam, m.p. 41° (44), together with (60% yield (44)) 3-chloro-4-nitrophenol [Beil. VI-240], not volatile with steam, white ndls. from dil.  $HCl$  or aq., m.p. 121–122° (44). — Note that the two other position isomers although known have been obtd. indirectly: 3-chloro-2-nitrophenol, anhydrous form, yel. cryst., m.p. 45–47° (46) (47); monohydrate, colorless cryst. from pct. ether, m.p. 37.5–38° (46) (47) (44); 3-chloro-5-nitrophenol [Beil. VI-239] (48), m.p. 147°.]

[ $\bar{C}$  on dinitration as directed (44) (49) gives 3-chloro-4,6-dinitrophenol [Beil. VI-250, VI-1-28], colorless cryst. from aq. or lt. pct., m.p. 92–93° (44). — Note that two other position isomers are known but prepd. indirectly: 3-chloro-2,6-dinitrophenol, white cryst. from dil.  $HCl$ , m.p. 114.5° (44) (49); 3-chloro-2,4-dinitrophenol, cryst. from aq., m.p. 138–140° (44) (49).]

$\bar{C}$  on trinitration by soln. in  $1\frac{1}{2}$  pts. fuming  $H_2SO_4$  (27%  $SO_3$ ) and treated in cold for 1 hr. with 10 pts. 70%  $HNO_3$  (44) cf. (4) (50) yields 3-chloro-2,4,6-trinitrophenol [Beil. VI-292], cryst. from aq. nr dil.  $H_2SO_4$ , m.p. 114° (44), 116° (4), 119° (50). — [Note that if  $\bar{C}$  is sulfonated prior to trinitration the isomeric 3-chloro-2,5,6-trinitrophenol, m.p. 112.5–113.5° (44), is obtd. (44).]

[For studies on the sulfonation of  $\bar{C}$  see (44) (51) (52) (53).]

[ $\bar{C}$  in  $MeOH/KOH$  with  $MeI$  yields (29) *m*-chlorophenyl methyl ether (*m*-chloroanisole) (8:6105).] [ $\bar{C}$  in  $EtOH/KOH$  with  $EtI$  gives (18) 3-chlorophenyl ethyl ether (*m*-chlorophenetole) (3:6323), b.p. 204–205° at 717 mm.,  $D_4^{20} = 1.1712$  (18) (for rate of formn. from sodium salt of  $\bar{C}$  with  $EtI$  in alc. soln. see (55)).]

— *m*-Chlorophenyl acetate [Beil. VI-185]: nil, b.p. 116.6° at 21 mm. (18), 108° at 12 mm. (57), 84–86° at 2 mm. (57), m.p.  $-1.5^\circ$  to  $-0.5^\circ$  (18),  $D_4^{20} = 1.2200$  (18).

[From  $\bar{C}$  with  $Ac_2O$  +  $NaOAc$  (18) nr indirectly from *m*-chloroaniline via diazotiazation, etc. (57).] [For rate of reactn. of  $\bar{C}$  with  $AcBr$  see (58).]

① *m*-Chlorophenyl benzoate [Beil. IX-117]: pr. from dil. alc. or dil. acetone, m.p. 71–72° (18). [From  $\bar{C}$  in 10% aq.  $Na_2CO_3$  with  $BzCl$  (18); for study of rate of benzoylation of  $\bar{C}$  see (59).]

② *m*-Chlorophenyl *m*-nitrobenzoate: ndls. from alc. or dil. acetone, m.p. 94–95° (18). [From  $\bar{C}$  in alk. with *m*-nitrobenzyl chloride (18).]

③ *m*-Chlorophenyl *p*-nitrobenzoate: m.p. 90°.

④ *m*-Chlorophenyl 3,5-dinitrobenzoate: m.p. 156°.

— *m*-Chlorophenyl benzenesulfonate: unrecorded.

— *m*-Chlorophenyl *p*-toluenesulfonate: unrecorded.

— *m*-Chlorophenyl benzyl ether: m.p. 59°. [From  $\bar{C}$  + benzyl-phenyl-dimethyl-ammonium chloride (60).]

— *m*-Chlorophenyl *p*-nitrobenzyl ether: unrecorded.

- *m*-Chlorophenyl 2,4-dinitrophenyl ether: pale yel. ndls. from alc., m.p. 75° (61). [From  $\bar{C}$  in alk. with alc. 2,4-dinitrochlorobenzene (61).]
- ⑥ *m*-Chlorophenoxyacetic acid: cryst from aq., m.p. 108–110° u.c. (62), Neut. Equiv. 186.5. [From  $\bar{C}$  in aq. NaOH with chloroacetic acid (62).]
- *m*-Chlorophenyl *N*-phenylcarbamate: unrecorded.
- ⑦ *m*-Chlorophenyl *N*-(*p*-bromophenyl)carbamate: ndls. from  $C_6H_6$  + EtOAc, m.p. 121–123° cor. (64). [From  $\bar{C}$  + *p*-bromobenzazide in lgr. (64).]
- ⑧ *m*-Chlorophenyl *N*-(*p*-iodophenyl)carbamate: m.p. 138–139° (69). [From  $\bar{C}$  with *p*-iodobenzazide in hot lgr. (69).]
- ⑨ *m*-Chlorophenyl *N*-(*m*-nitrophenyl)carbamate: m.p. 115–116° u.c., 117–118° cor. (70). [From  $\bar{C}$  with *m*-nitrobenzazide or with *m*-nitrophenyl isocyanate in lgr. (70).]
- ⑩ *m*-Chlorophenyl *N*-(*p*-nitrophenyl)carbamate: pale yel. pr. from lgr., m.p. 144° cor. (65). [From  $\bar{C}$  + *p*-nitrobenzazide in lgr. (65).]
- ⑪ *m*-Chlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate: or.-yel. pr. from lgr., m.p. 170–172° u.c., 174–176° cor. (63). [From  $\bar{C}$  with 3,5-dinitro-4-methylbenzazide in lgr. (63).]
- ⑫ *m*-Chlorophenyl *N*-( $\alpha$ -naphthyl)carbamate: cryst. from lgr., m.p. 157–158° (66). [From  $\bar{C}$  +  $\alpha$ -naphthyl isocyanate in lgr. (66).]
- ⑬ *m*-Chlorophenyl *N*-( $\beta$ -naphthyl)carbamate: pr. from lgr., m.p. 114–115° u.c., 116–117° cor. (67). [From  $\bar{C}$  +  $\beta$ -naphthyl isocyanate (or azide) in lgr. (67).]
- *m*-Chlorophenyl *N,N*-diphenylcarbamate: unreported.

150-155° at 10 mm. (5)

Cryst. from alc. — Volatile with steam (6). — Sol. alc.,  $CCl_4$  (7); very sol.  $C_6H_6$  or pet. eth. (2).

[For prepn. (36.8% yield (7)) (together with other products) from biphenyl by direct chlorination in presence of Fe or other cat. see (7) (2) (8) (9); for prepn. (25-38% yield (5)) from diazotized *o*-chloroaniline +  $C_6H_6$  see (5) (4); for prepn. (60% yield (15)) from diazotized *o*-aminobiphenyl via  $Cu_2Cl_2$  method see (15) (10).]

[ $\bar{C}$  with  $C_6H_6 + AlCl_3$  in  $CS_2$  gives (37) (38) (39) (41) (by combined ring closure and addition to the unsatd. linkage or vice versa) 3-phenylhydrindone-1 (3-phenylindanone-1) [Beil. VII-483, VII<sub>1</sub>-(265)], cryst. from MeOH, m.p. 78° (37), 77-78° (39) (oxime, m.p. 141° (40), phenylhydrazone, m.p. 130° (40), *p*-nitrophenylhydrazone, m.p. 220-221° (39), semicarbazone, m.p. 223-225° (39)), accompanied by  $\beta,\beta$ -diphenyl-propionophenone (1,3,3-triphenylpropanone-1) [Beil. VII-524, VII<sub>1</sub>-(293)] (38) and other prods.: note that under similar condns (41) with toluene or *o*-xylene neither of the corresp. indanones is formed (see also below); however,  $\bar{C} + m$ -xylene +  $AlCl_3$  in  $CS_2$  yields (41) 5,7-dimethyl-3-phenylindanone-1, m.p. 101° (semicarbazone, m.p. 195-197° (41)), and  $\bar{C} + p$ -xylene +  $AlCl_3$  in  $CS_2$  yields (41) 4,7-dimethyl-3-phenylindanone-1, m.p. 94-95° (oxime, m.p. 218-219°; phenylhydrazone, m.p. 193-194°; semicarbazone, m.p. 232° (41)).]

[ $\bar{C}$  with many arom. epds. in pres. of  $AlCl_3$  condenses with loss of HCl to yield corresp. benzalacetophenone (chalcone) derivs.:  $\bar{C}$  with  $C_6H_6 + AlCl_3$ , however, gives no (41) chalcone (see above);  $\bar{C}$  with toluene +  $AlCl_3$  yields (41) 4'-methylchalcone;  $\bar{C}$  with *o*-xylene +  $AlCl_3$  in  $CS_2$  gives (63% yield (41)) 2'-methylchalcone;  $\bar{C}$  with *m*-xylene +  $AlCl_3$  in  $CS_2$  yields (41) 3'-methylchalcone;  $\bar{C}$  with biphenyl +  $AlCl_3$  in  $CS_2$  yields (41) 4'-phenylchalcone, m.p. 155-156° (45), 165° (11)]

[Similar chalcone formation occurs w many arom. ethers; e.g.,  $\bar{C}$  with anisole +  $AlCl_3$  in  $CS_2$  gives (42) 4'-methoxychalcone [Beil. VIII-193, VIII<sub>1</sub>-(560)], m.p. 106-107° (42);  $\bar{C}$  similarly with phenetole gives (42) 4'-ethoxychalcone [Beil. VIII-193], m.p. 74-75° (42);  $\bar{C}$  similarly with methyl *p*-tolyl ether gives (43) not only 2'-methoxy-5'-methylchalcone, m.p. 55-56°, but also by demethylation 2'-hydroxy-5'-methylchalcone, m.p. 111° (43);  $\bar{C}$  similarly with methyl 3,4-dimethylphenyl ether yields (13) 4',5'-dimethyl-2'-methoxychalcone, m.p. 78° (13);  $\bar{C}$  similarly with methyl  $\beta$ -naphthyl ether yields (44)  $\beta$ -methoxynaphthochalcone, m.p. 138-140° (44);  $\bar{C}$  similarly with diphenyl ether yields (37) 4'-phenoxychalcone, m.p. 85° (37); for extension of this reactn. to ethers of polyhydric phenols such as  $\bar{C} + AlCl_3 +$  catechol dimethyl ether (veratrole) (1:7560) (44), resorcinol dimethyl ether (1:7570) (13), resorcinol diethyl ether (1:7585) (13) (43), hydroquinone diethyl ether (1:7185) (43), and pyrogallol trimethyl ether (1:7145) (44) see indic. refs.]

[Similar formation of substituted chalcones occurs with  $\bar{C} + AlCl_3 +$  phenols; e.g., for cases of  $\bar{C}$  with *o*-cresol (1:1400) (46), resorcinol (1:1530) (47), phloroglucinol (1:1620) (47) cf. (48) see indic. refs.]

[ $\bar{C}$  with diazomethane in ether gives (49) (50) (note both replacement of Cl and addn. to unsatd. linkage) 5-(diazooacetyl)-4-phenylpyrazoline, cryst. from  $C_6H_6 +$  pet. eth.; m.p. 80-81° (49), 77-78° (50)]

[ $\bar{C} + NaN_3$  in ether gives (12% yield (51)) (52) cinnamoyl azide, cryst. from lgr., m.p. 86° dec. (51) (52); this cpd. on htg above m.p. or preferably in  $C_6H_6$  readily loses  $N_2$  and rearr. giving (77% yield (53)) (51) (52) styryl isocyanate, b.p. 107° at 12 mm.; this isocyanate (or even its azide precursor) with aq. at 50° yields (51) *N,N'*-distyrylurea, m.p. 213-214° (51); for its reactn. with MeOH yielding (52) methyl *N*-styrylcarbamate, m.p. 126°, with EtOH yielding (52) ethyl *N*-styrylcarbamate, m.p. 87°, with ammonia gas in dry ether yielding (51) *N*-styrylurea, m.p. 143°, or with aniline yielding (52) *N*-phenyl-*N*-styrylurea, m.p. 217°, see indic. refs.]

[ $\bar{C}$  with free  $NH_2OH$  in  $C_6H_6$  gives (100% yield (16)) cinnamoylhydroxamic acid, cryst. from hot EtOAc by addn. of lgr., m.p. 119.5° (16), 111.5° (54)]

[ $\bar{C}$  htd. with urea at 70° gives (44% yield (55)) (56) *N*-cinnamoylurea, m.p. 208-209° (55), 197° (56).]

[For reactn. of  $\bar{C}$  with  $C_6H_5MgBr$  see (58); for reactn. of  $\bar{C}$  with cellulose see (59); for reactn. with *o*-aminothiophenol yielding 1-styrylbenzothiazole see (60); for reactn. of  $\bar{C}$

3:0360 (1) Hinkel, Hey, *J. Chem. Soc.* 1928, 2786-2791, (2) Scarborough, Waters, *J. Chem. Soc.* 1927, 93.

3:0370 3,5-DICHLOROBENZAL (DI)CHLORIDE  $C_7H_4Cl_4$  Beil. S.N. 466

M.P. 36.5° (1)

Colorless cryst. from MeOH or from dil. AcOH; eas. sol. usual org. solv. [Note that  $\bar{C}$  has same m.p. as the closely related 3,5-dichlorobenzyl chloride (3:0350) but that a mixture of the two becomes liquid.]

[For prepn. of  $\bar{C}$  from 3,5-dichlorobenzaldehyde (3:1475) with  $PCl_5$  (80% yield) see (1).]

$\bar{C}$  on hydrolysis with fuming  $H_2SO_4$  as directed gives (71-80% yield (1)) 3,5-dichlorobenzaldehyde (3:1475) (for study of rate of hydrolysis in 50% alc. at 83.5° see (2)).

3:0370 (1) Asinger, Lock, *Monatsh.* 62, 347 (1933). (2) Asinger, Lock, *Monatsh.* 62, 337-338 (1933).

3:0372 2,4,6-TRIMETHYLBENZYL CHLORIDE  $C_{10}H_{13}Cl$  Beil. S.N. 469  
( $\alpha^2$ -Chloroisodurene)

M.P. 37° (1) (2) (3) (4) B.P. 130-131° at 22 mm. (1)  
121-123° at 19 mm. (2)  
119° at 15 mm. (4)  
114-115° at 10 mm. (3)

[See also the isomeric 2,4,5-trimethylbenzyl chloride (3:9702).]

Colorless cryst. from alc. (4). —  $\bar{C}$  hlisters skin (3). — [Equiv. conductance of  $\bar{C}$  in liq.  $SO_2$  is 10 times that of benzyl chloride (3:8535) (3) cf. (5).]

### PREPARATION OF $\bar{C}$

[For prepn. of  $\bar{C}$  from 1,3,5-trimethylbenzene (mesitylene) (1:7455) with formalin (1:0145) + conc. HCl + HCl gas at 55° for 5½ hrs. (yields: 55-61% (1), 29% (3)) (some  $\alpha^2, \alpha^4$ -dichloropentamethylbenzene = bis-1,3-(chloromethyl)2,4,6-trimethylbenzene, cryst. from pet. eth., m.p. 105° (1) (3), is also formed) see indic. refs.]

[For prepn. of  $\bar{C}$  from mesitylene (1:7455) with chloromethyl methyl ether (3:7085) +  $SnCl_4$  (yields: 60% (4) cf. (6)), or in AcOH without other cat. (yields: 80-85% (7), 80% (2)), or with chloromethyl ethyl ether (3:7195) +  $SnCl_4$  in  $CCl_4$  soln. at -5° (70% yield (8)), see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Reduction. [ $\bar{C}$  with  $H_2$  + Pt cat. in alc. soln. gives (80% yield (2) cf. (7)) 1,2,3,5-tetramethylbenzene (isodurene) [Beil. V-430, V<sub>2</sub>(329)] (9), liquid, b.p. 195-197° at 760 mm., f.p. -24°,  $D_4^{20} = 0.8906$ .]

Hydrolysis.  $\bar{C}$  on hydrolysis (no details (2)) gives 2,4,6-trimethylbenzyl alc. (mesitylcarbinol), ndls. from alc., m.p. 89° (2), 88-89° (10) (3) (11), 87° (12) (corresp. *N*-phenylcarbamate, m.p. 124-125° (11)).

Conversion to ethers.  $\bar{C}$  with MeOH/KOH at 100° for 3 hrs. gives (70% yield (3)) methyl 2,4,6-trimethylbenzyl ether, oil, b.p. 109–110° nt 15 mm. (3),  $\bar{C}$  with EtOH/KOH similarly gives (77% yield (3)) ethyl 2,4,6-trimethylbenzyl ether, oil, b.p. 114–115° at 14 mm. (3).]

Conversion to esters.  $\bar{C}$  with AgOAc in AcOH nt 100° for 3 hrs. gives (70% yield (3)) 2,4,6-trimethylbenzyl acetate, oil, b.p. 136–137° at 15 mm. (3); this ester on hydrolysis with 15% aq. KOH at 100° for 3 hrs. gives (91% yield (3)) 2,4,6-trimethylbenzyl alc., m.p. 88–89°. (See also above.)]

Conversion to nitrile.  $\bar{C}$  in alc. with aq. NaCN (1) (13) or KCN (4) (8), or C with CuCN in pyridine (14) cf. (1), gives (yields: almost 100% (13), 89–93% (1)) mesitylacetoneitrile, cryst. from pet. eth., m.p. 79–80° (1), 79° (4); b.p. 160–165° at 22 mm. (13), 150–155° at 15 mm. (4), 190° at 11 mm. (8); this nitrile on hydrolysis with abt. 50% H<sub>2</sub>SO<sub>4</sub> under reflux for 6 hrs. gives (87% yield (1)) mesitylacetic acid [Beil. IX-563, IX<sub>1</sub>-(219)], cryst. from dil. alc. or lgr., m.p. 167–168° (1) (note that partial hydrolysis may give mesitylacetamide, m.p. 216° (8)).

#### BEHAVIOR OF $\bar{C}$ WITH ORGANOMETALLIC COMPOUNDS

With MeMgI.  $\bar{C}$  with MeMgI in dry ether undergoes mainly a coupling reaction giving (86% yield (15)) 1,2-dimesitylethane, m.p. 117.0–117.5°, accompanied by a little ethylmesitylene (1-ethyl-2,4,6-trimethylbenzene), b.p. 212–214° (15), 210° at 725 mm. (16),  $D_{20}^{20} = 0.894$  (16),  $n_D^{20} = 1.5074$  (16) (corresp. dinitro deriv., m.p. 111° (17), 109–111° (17) (15)).]

With misc. reactants.  $\bar{C}$  with diethyl sodiomalonate gives (4) diethyl  $\alpha$ -(2,4,6-trimethylbenzyl)malonate, m.p. 36°, b.p. 195–197° at 15 mm. (4). —  $\bar{C}$  with ethyl sodio-benzoylacetate gives (21% yield (18)) ethyl  $\alpha$ -(2,4,6-trimethylbenzyl)benzoylacetate which upon alk. hydrolysis gives (45% yield (18)) the ketone 1-benzoyl-2-mesitylethane, ndls. from MeOH, m.p. 85.0–85.5° (18).]

#### OTHER REACTIONS OF $\bar{C}$

$\bar{C}$  (1 mole) with hexamethylenediamine (1 mole) in CHCl<sub>3</sub> refluxed 3 hrs. gives (96% yield (19)) corresp. quaternary salt,  $\bar{C}_6H_{12}N_4$ : this prod. in nq. refluxed 4 hrs does not give the expected mesitaldehyde but instead (75% yield (19)) di-(2,4,6-trimethylbenzyl-amino)methane, cryst. from alc., m.p. 151.5–152° (19) ]

⑩ *N*-(2,4,6-Trimethylbenzyl)phthalimide: ndls. from alc., m.p. 209.5–210° (19). [*From*  $\bar{C}$  with K pbthalamide at 170–180° for 4 hrs. as directed (19) (63% yield (19)).]

### 3:0425 2,3,4-TRICHLOROTOLUENE

 $C_7H_5Cl_3$ 
*Beil.* V - 298

 $V_1$ —

 $V_2$ -(232)

M.P. 41° (1) (2) (3) B.P. 231-232° at 716 mm. (1)  
40-41° (4)

Ndls. from MeOH or EtOH; volatile with steam.

[For prepn. of  $\bar{C}$  from 2,3-dichloro-4-aminotoluene (*Beil.* XII-990) via diazotization and use of  $Cu_2Cl_2$  reaction see (4); from toluene with  $AlCl_3 + SO_2Cl_2$  (34%  $\bar{C}$  + 40% 2,4,5-trichlorotoluene (3:2100)) see (2); for formn. of  $\bar{C}$  (together with other isomers) from toluene, *o*-chlorotoluene (3:8245), or *p*-chlorotoluene (3:8287) with  $Cl_2$  see (1), from 2,3-dichlorotoluene (3:6345) or 2,4-dichlorotoluene (3:6290) with  $Cl_2$  in pres. of  $Al/Hg$  see (5); for prepn. of  $\bar{C}$  from its sulfonic acid by hydrolysis see (1) (7).]

[ $\bar{C}$  with  $Cl_2$  in pres. of  $Al/Hg$  yields (6) 2,3,4,6-tetrachlorotoluene (3:2450).]

$\bar{C}$  on mononitration (1) (4) by soln. in cold fuming  $HNO_3$  yields a mononitro  $\bar{C}$  (*Beil.* V-333), ndls. from alc., m.p. 60-61° (4), 60° (1);  $\bar{C}$  on dinitration by warming with a mixt. of 2 pts. fuming  $HNO_3$  and 1 pt. conc.  $H_2SO_4$  (1) (4) cf. (7) yields 2,3,4-trichloro-5,6-dinitrotoluene [*Beil.* V-345], ndls. from alc., m.p. 141° (1) (2), 140-141° (4).

$\bar{C}$  on shaking with 2 pts. fuming  $H_2SO_4$  at 60° yields (1) (7) a monosulfonic acid (use in sepn. of  $\bar{C}$  from 2,4,5-trichlorotoluene (3:2100) which is not sulfonated under these conditions (1) (7)).

$\bar{C}$  on oxidn. with dil.  $HNO_3$  in s.t. at 150° (4) yields 2,3,4-trichlorobenzoic acid (3:4810), m.p. 186-187° (4).

### 3:0440 CHLOROPIVALIC ACID ( $\beta$ -Chloro- $\alpha,\alpha$ - dimethylpropionic acid)

 $C_6H_9O_2Cl$ 
*Beil.* S.N. 162

M.P. 40-42° (1) B.P. 126-129° at 30 mm. (1)

[For prepn. of  $\bar{C}$  from pivalic acid (trimethylacetic acid) (1:0410) with  $SO_2Cl_2$  + dibenzoyl peroxide in  $CCl_4$  see (1).]

Ⓒ Chloropivalamide: pl. from aq., m.p. 108-109° (1).

3:0440 (1) Kharasch, Brown, *J. Am. Chem. Soc.* 62, 925-929 (1940). (2) Kharasch, Brown (to du Pont Co.), U.S. 2,302,228, Nov. 17, 1942; *C.A.* 37, 2018 (1943).

M.P. 41-42° (1)

[For prepn. of  $\bar{C}$  from 2,6-dimethylheptanediol-2,6 [Beil. I-494] (2) with conc. HCl or AcCl see (1) (2); from the corresponding internal ether, viz.,  $\alpha, \alpha, \alpha', \alpha'$ -tetramethylpentamethylene oxide (2,2,6,6-tetramethyltetrahydropyran) [Beil. XVII-17], with HCl see (1).]

$\bar{C}$  on warming with aq. readily hydrolyzes (1) back to 2,6-dimethylheptanediol-2,6 (monohydrate, cryst. from  $C_6H_6$ , m.p. 60-61°; anhydrous form by heating monohydrate at 135-140°, m.p. 76-77° (1)).

[ $\bar{C}$  in  $C_6H_6$  + AcOH treated with Zn dust in a stream of dry HCl yields (2) mixt. of  $\alpha$ - and  $\beta$ -cyclogeraniols [Beil. VI-66, VI-(43)].]

3:0455 (1) Bruylants, *Bull. acad. roy. Belg.* 1909, 276-282; *Cent.* 1909, II 797; *C.A.* 4, 1485 (1910); *Rec. trav. chim.* 29, 130-133 (1910). (2) Staudinger, Widmer, *Helv. Chim. Acta* 9, 531, 546-547 (1926).

M.P. 42°	(1) (2)	B.P. 204°	(11)
41.5°	(3)	203-205° at 764 mm.	(12)
41°	(4) (19)	127° at 35 mm.	(13)
40.5° cor.	(5)	120° at 30 mm.	(27)
40°	(6) (7)	124° at 25 mm.	(1)
39°	(8) (9)	105-107° at 20 mm.	(14)
38.5-39.5°	(10)	108° at 12 mm.	(1)

Lfts. from lgr. or pet. eth. — Very eas. sol. aq., alc.,  $CHCl_3$ ; spar. sol. dry ether. — Fairly, hygroscopic. —  $\bar{C}$  on boilg. slightly dec. to HCl + acrylic ac. (1:1020). [Note that samples with m.p. higher than 42° may have contd. adipic ac. (8).] [For stability of  $\bar{C}$  in aq. soln. see (8).]

[For prepn. of  $\bar{C}$  from acrolein (1:0115) via addn. of HCl to  $\beta$ -chloropropionaldehyde (3:5576) and subsequent oxidn. with fuming  $HNO_3$  (yield: 65-70% (14), 60-65% (15), 50% (1)) see (15) (14) (7) (1) (16); from 3-chloropropanol-1 (trimethylene chlorohydrin) (3:8285) by oxidn. with conc.  $HNO_3$  (yield: 78-79% (9)) (17) (13) (27) or alk.  $KMnO_4$  (18) see indic. refs.; from  $\beta$ -hydroxypropionitrile (ethylene cyanohydrin) by hydrolysis with HCl see (10); from phosgene + ethylene +  $AlCl_3$  via hydrolysis of intermediate  $\beta$ -chloropropionyl chloride (3:5690) see (19); for other methods see Beil. II-249.]

$\bar{C}$  on htg. with aq. alk. or alk. carbonates (1) (7) (19) or on passing over activated carbon at 230-240° at 250-320 mm. (21) loses HCl and yields acrylic ac. (1:1020). [The alk. salts of  $\bar{C}$  dec. even at ord. temp. giving alk. chlorides (3).] [For example of use of  $\bar{C}$  as source of acrylic acid in Diels-Alder addn. reactions see under 9,10-dichloroanthracene (3:4916).]

$\bar{C}$  with  $PCl_3$  (12) or  $SOCl_2$  (22) yields  $\beta$ -chloropropionyl chloride (3:5690) q.v., b.p. 144°.

$\bar{C}$  (1 g.) + pyridine (2 g.) htd. at 100° solidifies after 2 hrs. to give 100% yield addn. cpd.  $\bar{C}.C_5H_5N$ , pr. from abs. alc., m.p. 160° (26).

— Methyl  $\beta$ -chloropropionate: b.p. 148–150° at 760 mm. (3:5765)

— Ethyl  $\beta$ -chloropropionate: b.p. 162–163° at 760 mm. (3:8290).

—  $\beta$ -Chloropropionamide: unrecorded.

①  $\beta$ -Chloropropionanilide: cryst. from aq. or MeOH, m.p. 119° (23). [From  $\beta$ -chloropropionyl chloride + aniline in acetone in 90% yield (23).]

②  $\beta$ -Chloropropion-*p*-toluidide: cryst. from MeOH, m.p. 121° (23) (22).

③  $\beta$ -Phenoxypropionic acid: ndls. from bot aq. (24) or lgr. (25); m.p. 98° (24), 97–98° (25). [From  $\bar{C}$  + phenol + NaOH, 36% yield (25).]

### 3:0470 PENTACHLOROPROPIONYL CHLORIDE

$C_3OCl_5$  Beil. II —

M.P. 42° (1)

Colorless not especially hygroscopic ndls.

[For prepn. of  $\bar{C}$  from trichloroacrylic acid chloride (3:5845) by addn. of  $\text{Cl}_2$  in bright sunlight see (1).]

$\bar{C}$  with  $\text{AlCl}_3$  (1 mole) at 60° decomposes in two ways (1), leading on one hand to CO and hexachlorethane (3:4835), and on the other to phosgene (3:5000) and tetrachloroethylene (3:5460).

[ $\bar{C}$  with  $\text{C}_6\text{H}_6$  +  $\text{AlCl}_3$  yields (1) pbenyl pentachloroethyl ketone ( $\alpha,\alpha,\beta,\beta,\beta$ -pentachloropropiophenone) (Beil. VII<sub>1</sub>-(161)), m.p. 83° (1).]

$\bar{C}$  on hydrolysis yields pentachloropropionic acid (3:4895).

3:0470 (1) Böeseken, Hasselbach, *Rec. trav. chim.* 32, 11–13 (1913).

3:0475 *p*-CHLOROPHENOL $\text{C}_6\text{H}_5\text{OCl}$ 

Beil. VI - 186

[See also *o*-chlorophenol (3:5980).]

$\bar{C}$  has disagreeable and persistent odor (15) for study of strength of which in aq. soln. see (16). —  $\bar{C}$  is spar. sol. aq. at ord. temp. (for details see (17)); but  $\bar{C}$  is eas. sol. alc., ether,  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ ,  $\text{CS}_2$ . —  $\bar{C}$  (like its *o*-isomer (3:5980)) is volatile with steam (for studies see (18)) even from soln. in equiv. aq.  $\text{NaOH}$  (19) (dif. and sepn. from 2,4-dichlorophenol (3:0560), 2,6-dichlorophenol (3:1595), and 2,4,6-trichlorophenol (3:1673) (19).

The cryoscopic const. of  $\bar{C}$  is 85.8 (20).

SELECTED DATA ON BINARY SYSTEMS CONTG.  $\bar{C}$ 

$\bar{C}$  + aq.: for solubility/temp. data see (17).

$\bar{C}$  +  $\text{C}_6\text{H}_6$ : for solubility/temp. data (17) or for vapor-press. data (21) see indic. refs.; for association of  $\bar{C}$  in  $\text{C}_6\text{H}_6$  soln. see (30).  $\bar{C}$  +  $\text{MeOH}$  (1:6120): for vapor-press. data see (21).  $\bar{C}$  + acetone (1:5400): for vapor-press. data see (21).  $\bar{C}$  + methyl acetate (1:3005): for vapor-press. data see (21).

$\bar{C}$  + nitrobenzene: for f.p./compn. data and diagrams see (24) (25), eutectic m.p.  $-24.5^\circ$  contg. 41.5 wt. %  $\bar{C}$  (24), m.p.  $-30.5^\circ$  contg. 60.5 mol. %  $\bar{C}$  (25).

$\bar{C}$  + aniline: for  $D^{25}$  and  $D^{50}$  + viscosity nt 25° and 50° see (26).  $\bar{C}$  + *p*-toluidine: for f.p./compn. and  $n_D^{54}$ /compn. data and diagrams see (4) cf. (29); note two eutectics,  $E_1$ , m.p.  $21^\circ$  contg. 28 mol. %  $\bar{C}$ , and  $E_2$ , m.p.  $7.4^\circ$  contg. 71 mol. %  $\bar{C}$  (4).  $\bar{C}$  + benzylamine: for f.p./compn. diagram see (27), noting two molecular cpds., one of compn. 3  $\bar{C}$ :1 benzylamine, m.p.  $55^\circ$ , the other 1  $\bar{C}$ :1 benzylamine, m.p.  $16^\circ$  (27).  $\bar{C}$  + phenylhydrazine: for f.p./compn. data and diagram see (1).

$\bar{C}$  + piperidine: for  $n_D^{55}$ /compn. data see (23).

$\bar{C}$  + pyridine: for f.p./compn. diag. of entire system see (4) cf. (28) (note two eutectics, viz.,  $E_1$ , m.p.  $-19.5^\circ$  contg. 66.6 mol. %  $\bar{C}$ ,  $E_2$ , m.p.  $-47.3^\circ$  contg. 13.5 mol. %  $\bar{C}$ ); for  $n_D^{25}$ /compn. and  $n_D^{50}$ /compn. data over entire system see (14).

$\bar{C}$  + *o*-chlorophenol (3:5980): for f.p./compn. data and diagram see (3) (note that the eutectic, m.p. about  $-20.5^\circ$ , conts. about 33.5 mol. %  $\bar{C}$ ).  $\bar{C}$  + *p*-dichlorobenzene (3:0980): for f.p./compn. diagram see (4) (note eutectic m.p.  $27.2^\circ$  contg. 73.4 mol. %  $\bar{C}$ ); for  $n_D^{54}$ /compn. data see (4).

AZEOTROPIC SYSTEMS CONTG.  $\bar{C}$ 

$\bar{C}$  with naphthalene (1:7200) forms a const.-boilg. mixt., b.p.  $216.3^\circ$  contg. 36.5%  $\bar{C}$  (11).  $\bar{C}$  with *p*-dibromobenzene forms a const.-boilg. mixt., b.p.  $215.05^\circ$  contg. 35%  $\bar{C}$  (11).

PREPARATION OF  $\bar{C}$ 

From *p*-chloroaniline. [For prepn. of  $\bar{C}$  from *p*-chloroaniline {Beil. XII-607, XII-1-(304)}] via diazotization to salts of *p*-chlorobenzenediazonium hydroxide {Beil. XVI-463, XVI-1-(355)} and hydrolysis of the latter (yields not stated) (3) (10) in an inert solvent (31) see indic. refs.; for study of rate of hydrolysis (32) of *p*-chlorobenzenediazonium chloride and influence of light thereon (33) see indic. refs.]

From phenol. [For prepn. of  $\bar{C}$  from phenol (1:1420) with  $Cl_2$  at temps. over range  $40^\circ$ - $155^\circ$  see (3) cf. (6) (35); with  $Cl_2$  + conc. aq.  $NH_2CO_2$  soln. see (34), by use of *N,N*-dichlorobenzenesulfonamide in  $CHCl_3$  at  $-15^\circ$  see (36) (note that evidence ohld. from this reaction in pres. of isobutylene indicates that phenyl hypochlorite is first formed and subsequently rearranges (36)); by use of *N,N*-dichlorourea +  $HCl$  see (37), with  $EtOCl$  (3:7022) in  $CCl_4$  at  $-20^\circ$  see (38); or by use of  $SO_2Cl_2$  see (39) (40) (41) (for use of  $SO_2Cl_2$  on  $NaOC_6H_5$  see (7)). — Note that in all these methods some *o*-chlorophenol (3:5980) is usually also formed.]

From *p*-aminophenol. [For formn. of  $\bar{C}$  from *p*-aminophenol {Beil. XIII-427, XIII-1-(143)}] via diazotization, conversion to corresp.  $PtCl_4$  double salt, and dry distn. see (42); or via diazotization, conv. to corresp.  $ZnCl_2$  double salt, and decompn. by addn. of molten phenol (yield 40% accompanied by 41% hydroxybiphenyl + 11% diphenyl ether) see (43).]

From *p*-dichlorobenzene. [For prepn. of  $\bar{C}$  from *p*-dichlorobenzene (3:0980) with  $MeOH/NaOMe$  in s.t. at  $180^\circ$  (44) (45), or with  $MeOH/NaOH$  in s.t. at  $190$ - $195^\circ$  (90% yield (46)) or at  $200^\circ$  for 25 hrs. under press. (8), see indic. refs.; for use of aq. alk. or alk. earths with  $MeOH$  in pres. of copper salts at  $150$ - $190^\circ$  under press. see (47) (note, however, that, although the hydrolysis of *p*-dichlorobenzene to  $\bar{C}$  is markedly facilitated by presence of  $Cu$ , e.g., with aq.  $NaOH$ , maximum yield is 30% while with  $MeOH/NaOH$  +  $Cu$  yield is 85% (48), yet in presence of  $Cu_2O$  some ord. phenol (1:1420) is also formed (49); for prepn. of  $\bar{C}$  from *p*-dichlorobenzene (3:0980) by vapor-phase hydrolysis with steam + cat. at  $550$ - $850^\circ$  see (50).]

From other miscellaneous sources. [For formn. of  $\bar{C}$  from various *p*-chlorophenyl ethers by cleavage, e.g., from *p*-chloroanisole (3:6300) with conc.  $HCl$  in s.t. (51) or with  $MeOH/NaOMe$  in s.t. at  $176^\circ$  (45); from *p*-chlorophenetole (3:0090) with conc.  $HCl$  (52) or with  $HBr$  in  $AcOH$  (85% yield (53)); or from *p*-chlorophenoxyacetic acid (3:4375) with conc.  $HCl$  in s.t. at  $150^\circ$  (34), see indic. refs.]

[ $\bar{C}$  is also obtainable by hydrolysis of its various esters, but these need not be cited here.]

[For formn. of  $\bar{C}$  from *p*-bromophenol with  $SO_2Cl_2$  at ord. temp. see (55); from calcium salt of *p*-dichlorobenzenesulfonic acid with  $Ca(OH)_2$  +  $Cu$  at  $200$ - $220^\circ$  followed by removal of the sulfonic acid group from the resultant *p*-chlorophenolsulfonic acid see (56).]

BIOCHEMICAL ASPECTS OF  $\bar{C}$ 

[For studies involving fate of  $\bar{C}$  in animal metabolism see (57) (58) (59); for studies from various aspects of bactericidal and fungicidal action of  $\bar{C}$  see (60) (61) (62) (63) (64) (65) (67) (68).]

[For studies from various aspects of effect of  $\bar{C}$  and other chlorophenols on taste of water see (69) (70) (71) (72) (73).]

MISCELLANEOUS USES OF  $\bar{C}$ 

[For use of  $\bar{C}$  in selective solv. refining of mineral oils see (74); as denaturant for alc. see (75); as solv. for lignin see (76).]

QUANT. DETN. OF  $\bar{C}$ 

See text below under bromination of  $\bar{C}$ , iodination of  $\bar{C}$ , and nitration of  $\bar{C}$ .

CHEMICAL BEHAVIOR OF  $\bar{C}$ PYROLYSIS OF  $\bar{C}$ 

[ $\bar{C}$  on pyrolysis through silica tube at red heat gives (77) 3,6-dichlorodiphenylene oxide, m.p. 188° (77).]

REDUCTION OF  $\bar{C}$ 

[ $\bar{C}$  with  $H_2 + Ni$  cat. in aq. or nq. alc. alk. soln. loses chlorine quant. as  $HCl$  (78) (for study of rate see (79)); note also that  $\bar{C}$  with  $Li$  at 220° (80) or with  $Ca$  at 160° (80) followed by treatment with aq. gives (yields 14% and 36% resp.) phenol (1:1420). — Note that  $\bar{C}$  with aq.  $Cu_2O$  at 250–380° under press. gives (81) phenol (1:1420) (see also above under prepn. of  $\bar{C}$  from *p*-dichlorobenzene). — Note that reduction of  $\bar{C}$  to 4-chlorocyclohexanol-1 (3:9376) appears to be unreported.]

OXIDATION OF  $\bar{C}$ 

[ $\bar{C}$  on oxidn. with 35% peracetic acid at 25° gives (82) slowly (17 days) in small yield  $\beta$ -chloromuconic acid (2-chlorobutadien-1,3-dicarboxylic acid-1,4), m.p. 223°, accompanied in the mother liquor by some lactone ( $C_6H_4O_3Cl$ ) of 3-chloro-4,5-dihydroxyhexen-2-dioic acid-1,6, m.p. 177° (82). —  $\bar{C}$  on electrolytic oxidn. gives (83) benzoquinone-1,4 (1:9025).]

NUCLEAR SUBSTITUTION OF  $\bar{C}$ 

(See also below under condensation reactions of  $\bar{C}$ .)

**Halogenation of  $\bar{C}$ . Fluorination.** [The fluorination of  $\bar{C}$  has not been reported, and no fluoro- or difluoroderiv. of  $\bar{C}$  is known.]

**Chlorination.** [ $\bar{C}$  with  $Cl_2$  (2 moles) in  $AcOH$  in cold gives (80% yield (84)) 2,4-dichlorophenol (3:0560), m.p. 45°; presumably  $\bar{C}$  with  $Cl_2$  (3 moles) would give 2,4,6-trichlorophenol (3:1673), but such reaction is not actually reported. — For study of rate of chlorination of  $\bar{C}$  with  $Cl_2$  in  $CCl_4$  (85) or with  $NaOCl$  in alk. soln. at 25° (86), or behavior of  $\bar{C}$  with  $Cl_2$  in presence of radioactive  $HCl$  in  $C_6H_6$  soln. (87), see indic. refs.]

**Bromination.** [ $\bar{C}$  with  $Br_2$  (1 mmole) in  $CCl_4$  at room temp. gives (62% yield (88)) 2-bromo-4-chlorophenol, m.p. 33–34°, h.p. 121–123° at 10 mm. (corresp. benzoyl deriv., m.p. 99–100°) (88).]

$\bar{C}$  with  $Br_2$  (2 moles) in  $AcOH$  (89) (90) (91) or  $\bar{C}$  with  $Br_2$  (2 moles) in aq.  $KBr$  soln. (92) gives (yields not stated) 4-chloro-2,6-dibromophenol, ndls. from dil. alc., m.p. 92° (89), 90° cor. (92), 89° (90) (corresp. methyl ether, m.p. 74° (92); 2,4-dinitrophenyl ether, m.p. 145–146° (90), *p*-toluenesulfonate, m.p. 107–108° (90)). [Note difference from the isomeric 4-chloro-3,5-dibromophenol, m.p. 121° (93), 118° (94) (corresp. Me ether, m.p. 82.5° (93), benzoyl deriv., m.p. 132° (94)).]

[ $\bar{C}$  with  $Br_2$  (4 moles) in pres. of  $Fe$  powder gives (93) 4-chloro-2,3,5,6-tetra bromophenol, m.p. 215° (corresp. methyl ether, m.p. 161°, benzoyl deriv., m.p. 203° (93)).]

[For quant. detn. of  $\bar{C}$  by bromination with  $KBrO_3/KBr$  soln. see (95) (96) (97).]

**Iodination.**  $\bar{C}$  with  $I_2$  (1 mole) in aq.  $KI + conc. NH_4OH$  gives (88% yield (98)) 4-chloro-2-iodophenol, ndls. from  $CHCl_3$  or lt. pet., m.p. 78° (98) (99) (corresp. acetyl deriv., m.p. 57° (98); corresp. benzoyl deriv., m.p. 88° (99), 83–84° (98); corresp. *N*-phenylcarbamate, m.p. 128° (99)).

$\bar{C}$  with excess  $I_2$  in aq.  $KI + conc. NH_4OH$  (98), or  $\bar{C}$  in alk. soln. with  $I_2$  in aq.  $KI$  (92),

or  $\bar{C}$  in alk. soln. with  $I_2 + KIO_3$  followed by dil  $H_2SO_4$  (89), or  $\bar{C}$  with  $ICl$  (99), gives (89% yield (98)) 4-chloro-2,6-iodophenol, ndls. from alc. or lt. pet., m.p.  $109^\circ$  cor. (92),  $108^\circ$  (98) (100),  $107-108^\circ$  (89),  $106-107^\circ$  (99) (corresp. methyl ether, m.p.  $79^\circ$  (92); corresp. acetyl deriv., m.p.  $128^\circ$  (98),  $127.5^\circ$  (100)).

[For quant. detn. of  $\bar{C}$  by di-iodination using  $I_2 +$  borax soln. : : Nitration of  $\bar{C}$ .  $\bar{C}$  on mononitration with 30%  $HNO_3$  in cold (103), or with nitric acid (105). (Beil. VI-238, 101) (102) (corresp. ethyl ether, m.p.  $61-62^\circ$  (101); cor. (99)). — [For use of mononitration in quant. detn. of m. o-chlorophenol (3:5980) see (107) of (112).]

$\bar{C}$  on dinitration with conc.  $HNO_3$  (108) (or the above 4-chloro-2-nitrophenol on further nitration with fuming  $HNO_3$  (101)) gives 4-chloro-2,6-dinitrophenol (Beil. VI-260, VI-128), yel. ndls. or lfts. from aq., ndls. or pr. from alc., ether, or  $CHCl_3$ , m.p.  $81^\circ$  (108) (corresp. methyl ether, m.p.  $66^\circ$  (109),  $64^\circ$  (94), corresp. ethyl ether, m.p.  $54-55^\circ$  (110); corresp. *N*-phenylcarbamate cannot be prepared (111)).

Nitrosation of  $\bar{C}$ . [Unlike the isomeric o-chlorophenol (3:5980) the nitrosation of  $\bar{C}$  has not been reported, and no nitroso-*p*-chlorophenol is known.]

Sulfonation of  $\bar{C}$ . [ $\bar{C}$  with equiv. amt. fuming  $H_2SO_4$  ( $D = 1.90$ ) at  $100^\circ$  (113) (114) gives 4-chlorophenolsulfonic acid-2 (Beil. XI-236), deliquescent tbs. of monohydrate from aq., m.p.  $75-76^\circ$  (113) (for study of acid strength see (115)) — Note also that  $\bar{C}$  with very large excess (15 wt. pts.) fuming  $H_2SO_4$  (20%  $SO_2$ ) gives (80-85% yield (116)) a bimolecular condensation prod. of the above sulfonic acid.]

Mercuration of  $\bar{C}$ . [ $\bar{C}$  with  $HgO/HgSO_4$  on warming, followed by neutraliz. with  $NaOH$ , gives (117) 4-chloro-2-hydroxymercuriphenol (Beil. XVI-(564)). — For other studies of mono- and di-mercuration of  $\bar{C}$  see (118) (119); for patents see (120) (121).]

#### CONDENSATION REACTIONS INVOLVING NUCLEAR HYDROGEN OF $\bar{C}$

With alcohols.  $\bar{C}$  with alcs. contg. more than one C in pres. of conc.  $HClO_4$  at  $0-160^\circ$  gives ultimately (although doubtless through formn. of intermediate esters followed by rearr. or intermediate formn. of olefins followed by addn.) (122) the corresp. 2-alkyl-4-chlorophenols [e.g.,  $\bar{C}$  with isopropyl alc. (1:6135) + conc.  $HClO_4$  as directed (122) gives 4-chloro-2-isopropylphenol, sol. aq.  $NaOH$ , b.p.  $235-250^\circ$  accompanied by 4-chloro-2,6-diisopropylphenol, insol. aq.  $NaOH$ , m.p.  $260-265^\circ$ ].

With aldehydes. [ $\bar{C}$  with formaldehyde (1:0145) + conc.  $HCl + H_2SO_4$  is claimed (123) to undergo simple chloromethylation yielding 5-chloro-2-hydroxybenzyl chloride, m.p.  $85^\circ$  (123); note, however, that further condensation (involving 2 additional moles of formaldehyde) may occur giving (67% yield (121)) 6-chloro-8-(chloromethyl)benzodioxane-1,3, cryst. from  $MeOH$ , m.p.  $103^\circ$  (124). —  $\bar{C}$  with formaldehyde (1:0145) + aq. alkali gives (125) 4-chloro-2,6-bis-(hydroxymethyl)phenol ("p-chlorophenol dialcohol"), m.p.  $154^\circ$  (126) (corresp. mono-(*p*-toluenesulfonate), m.p.  $151^\circ$  (127)); note that reaction of  $\bar{C}$  with 1 mole formaldehyde to give 4-chloro-2-(hydroxymethyl)phenol (5-chlorosalicyl alcohol) is not reported although the latter (Beil. VI-893), m.p.  $93^\circ$ , is known.]

With  $CHCl_3$ , chloral, or hexamethylenetetramine. [ $\bar{C}$  with  $CHCl_3 + EtOH + aq. NaOH$  (128), or  $\bar{C}$  with hexamethylenetetramine in anhydrous glyceroboric acid at  $150-155^\circ$  followed by  $H_2SO_4$  hydrolysis (129), or  $\bar{C}$  with chloral + anhydrous  $Na_2HPO_4$  at  $70-75^\circ$  (giving (4-chloro-2-hydroxyphenyl)-trichloromethyl-carbinol cf. (130)) followed by hydrolysis + oxidation (131), gives (18% yield (129)) 5-chloro-2-hydroxybenzaldehyde (5-chlorosalicylaldehyde) (3:2800), m.p.  $99-100^\circ$ .]

With  $\text{CCl}_4$ . [ $\bar{\text{C}}$  with  $\text{CCl}_4$  in aq.  $\text{NaOH}$  (128) in pres. of  $\text{Cu}$  or  $\text{Cu}$  compds. (132) or  $\bar{\text{C}}$  with  $\text{CCl}_4$  in alc.  $\text{KOH}$  in s.t. at  $140^\circ$  for 5-6 hrs. (133) gives 5-chloro-2-hydroxybenzoic acid (5-chlorosalicylic acid) (3:4705), m.p.  $172^\circ$ .]

With  $\text{CO}_2$  or organic acids. [ $\bar{\text{C}}$  (as dry  $\text{Na}\bar{\text{A}}$ ) with  $\text{CO}_2$  at  $140$ – $150^\circ$  under press. gives (135) (136) Na salt of 5-chlorosalicylic acid (3:4705) (see also above).]

[ $\bar{\text{C}}$  with *o*-chlorobenzoic acid (3:4150) in  $\text{MeOH}/\text{NaOMe}$  + trace  $\text{Cu}$  powder evapd., htd. at  $200^\circ$ , then htd. with conc.  $\text{H}_2\text{SO}_4$  for 15 min. gives (136) 2-chloroxanthone, m.p.  $165^\circ$  (136).]

With acid chlorides of organic acids. The conventional type of reaction of  $\bar{\text{C}}$  with acyl halides is to form the corresp. *p*-chlorophenyl esters (see also below under reactions of phenolic hydrogen of  $\bar{\text{C}}$ ); however, with  $\bar{\text{C}}$  acid chlorides in pres. of  $\text{AlCl}_3$  the ultimate product (undoubtedly formed by rearr. of an intermediate ester) is the ketone [e.g.,  $\bar{\text{C}}$  with benzoyl chloride (3:6240) +  $\text{AlCl}_3$  in  $\text{CS}_2$  (137) or acetylene tetrachloride (3:5750) (138) gives 4-chloro-2-benzoylphenol (5-chloro-2-hydroxybenzophenone), m.p.  $95.0$ – $95.5^\circ$  (138),  $94$ – $95^\circ$  (139),  $94^\circ$  (137),  $93$ – $94^\circ$  (140), frequently accompanied by *p*-chlorophenyl benzoate, m.p.  $87^\circ$  (see below); for analogous behavior of  $\bar{\text{C}}$  with *o*-toluyl chloride (3:8740) see (138)].

With anhydrides. [ $\bar{\text{C}}$  with phthalic anhydride (1:0725) +  $\text{AlCl}_3$  at  $140$ – $145^\circ$  (141) cf. (143) or in acetylene tetrachloride (3:5750) (142) gives (70% yield (142)) *o*-(5-chloro-2-hydroxybenzoyl)benzoic acid [Beil. X<sub>1</sub>-(470)], cryst. from hot  $\text{AcOH}$ , acetone, or alc., m.p.  $202^\circ$ , after sintering at  $102^\circ$  (142); this product ring-closes under the conditions of its formn. (141) (142) (143) (144) or with conc.  $\text{H}_2\text{SO}_4$  at  $100^\circ$  (144) (142) cf. (141) giving 4-chloro-1-hydroxyanthraquinone [Beil. VIII-340, VIII<sub>1</sub>-(651)], yel.-or. ndls. from  $\text{AcOH}$  or pyridine, m.p.  $194^\circ$  (141),  $103$ – $194^\circ$  (145),  $192$ – $103^\circ$  (146),  $189^\circ$  (142),  $188^\circ$  (147) (corresp. methyl ether, m.p.  $168^\circ$  (145), corresp. acetate, m.p.  $176$ – $177^\circ$  (146)), also ohtd. (70% yield (145)) directly from  $\bar{\text{C}}$  with phthalic anhydride (1:0725) +  $\text{AlCl}_3$  +  $\text{NaCl}$  at  $200$ – $220^\circ$  for 3 hrs. (See also next paragraph).]

[Note, however, that  $\bar{\text{C}}$  with phthalic anhydride (1:0725) + conc.  $\text{H}_2\text{SO}_4$  at  $200^\circ$  (148) (140) or in pres. of conc.  $\text{H}_2\text{SO}_4$  +  $\text{H}_3\text{BO}_3$  at  $200^\circ$  for  $3\frac{1}{2}$  hrs. (150) (151) (143) (152) (153) (154) (155) (156) goes further than above giving (yield: 68–74% (150)) 1,4-dihydroxyanthraquinone (quinizarin) (1:9085), cryst. from  $\text{AcOH}$ , m.p.  $200$ – $202^\circ$  cor. (150).]

[ $\bar{\text{C}}$  with 4-chlorophthalic anhydride (3:2725) +  $\text{H}_3\text{BO}_3$  + fume  $\text{H}_2\text{SO}_4$  at  $175$ – $195^\circ$  for 20 hrs. gives (167) 6-chloro-1,4-dihydroxyanthraquinone (6-chloroquinizarin), thls. from toluene, m.p.  $188^\circ$  (158) (corresp. dimethyl ether, m.p.  $168.5^\circ$  (158); diacetate, m.p.  $213^\circ$  (158)). — For completely analogous behavior under similar circumstances of  $\bar{\text{C}}$  with 3,4-dichlorophthalic anhydride (3:3695) or  $\bar{\text{C}}$  with 4,5-dichlorophthalic anhydride (3:4830) see these cpds.]

[ $\bar{\text{C}}$  with 4-sulfophthalic anhydride +  $\text{H}_3\text{BO}_3$  +  $\text{H}_2\text{SO}_4$  at  $200^\circ$  for 4 hrs. gives (45% yield (159) (160) cf. (161)) 1,4-dihydroxyanthraquinonesulfonic acid-6 (6-sulfoquinizarin) [Beil. XI-357]; for study of Na salt of latter as acid-base indicator see (162).]

[For behavior of  $\bar{\text{C}}$  with 3-methylphthalic anhydride +  $\text{AlCl}_3$  (144) (163), with 4-methylphthalic anhydride +  $\text{AlCl}_3$  (163), with naphthalene-1,2-dicarboxylic acid anhydride +  $\text{AlCl}_3$  +  $\text{NaCl}$  (164), or with naphthalene-2,3-dicarboxylic acid anhydride +  $\text{AlCl}_3$  +  $\text{NaCl}$  (165), see indic. refs.]

With esters of keto acids. [ $\bar{\text{C}}$  (1 mole) with ethyl acetoacetate (1:1710) + conc.  $\text{H}_2\text{SO}_4$  stood 24 hrs. gives (2.7% yield (166)) 6-chloro-2-methylcoumarin [Beil. XVII-336, XVII<sub>1</sub>-(173)], m.p.  $186$ – $187^\circ$  (167),  $186^\circ$  (168),  $185^\circ$  (170),  $184$ – $185^\circ$  (166),  $184^\circ$  (169); note, however, that 4-chloro-2-acetylphenol (5-chloro-2-hydroxyacetophenone) (see below) with  $\text{Ac}_2\text{O}$  +  $\text{NaOAc}$  at  $160$ – $170^\circ$  for 5 hrs. gives (167) both the above 6-chloro-2-methylcoumarin and the isomeric 6-chloro-2-methylchromone, ndls. from  $\text{AcOH}$ , m.p.  $115$ – $116^\circ$  (167).]

[Note also that  $\bar{\text{C}}$  with  $\alpha$ -alkylacetoacetates +  $\text{P}_2\text{O}_5$  gives the corresp. chromones: e.g.,

$\bar{C}$  with ethyl  $\alpha$ -methylacetoacetate (1:1712) gives (17% yield (171)) 6-chloro-2,3-dimethylchromone, m.p. 107°;  $\bar{C}$  with ethyl  $\alpha$ -ethylacetoacetate (1:1723) gives (171) 6-chloro-3-ethyl-2-methylchromone, m.p. 109°;  $\bar{C}$  with ethyl  $\alpha$ -(*n*-propyl)acetoacetate gives (172) 6-chloro-2-methyl-3-*n*-propylchromone, m.p. 108°;  $\bar{C}$  with ethyl  $\alpha$ -isopropylacetoacetate gives (172) 6-chloro-2-methyl-3-*n*-propylchromone, m.p. 108°;  $\bar{C}$  with ethyl  $\alpha$ -isopropylacetoacetate gives (172) 6-chloro-3-isopropyl-2-methylchromone, m.p. 127°.]

[ $\bar{C}$  with diethyl oxaloacetate + conc.  $H_2SO_4$  nt 0° gives (small yield (170)) ethyl 6-chlorocoumarin-4-carboxylate [Beil. XVIII<sub>1</sub>-(493)], yel. ndls., m.p. 96-97°;  $\bar{C}$  with diethyl acetonedicarboxylate (1:1772) + conc.  $H_2SO_4$  gives (6% yield (170)) ethyl 6-chlorocoumarinyl-4-acetate [Beil. XVIII<sub>1</sub>-(493)], m.p. 167°.]

With diazonium salts.  $\bar{C}$  in alk. soln. couples with diazonium salts giving upon acidification the corresp. chloro-hydroxy-azo derivs. [e.g.,  $\bar{C}$  with benzenediazonium chloride (aniline diazotized in HCl soln.) gives (173) 4-chloro-2-(benzeneazo)phenol (5-chloro-2-hydroxyazobenzene) [Beil. XVI-93], red-or. ndls. from AcOH, mp. 110-111° (173) (174);  $\bar{C}$  with diazotized *p*-nitroaniline gives (175) 4-chloro-2-(*p*-nitrobenzeneazo)phenol, m.p. 140-143°; for patent on coupling of  $\bar{C}$  with other diazonium salts see (176)].

With other miscellaneous reactants. [For condensation of  $\bar{C}$  with indene (di)chloride (2,3-dichloroindane) see (177); for condensation of  $\bar{C}$  with *o*-nitrobenzenesulfonic acid (178) or with 2-chloro-5-nitrobenzenesulfonic acid (179) see indic. refs.; for oxidative condensation of  $\bar{C}$  with *N,N*-dialkyl-*p*-phenylenediamines, etc., to give various indophenols see (180).]

[ $\bar{C}$  (2 moles) with  $SOCl_2$  (1 mole) in  $CCl_4$  at -10° (181) or in  $CS_2$  at 40-45° (70% yield (182)) or  $\bar{C}$  with  $S_2Cl_2$  in  $CS_2$  nt room temp. (42% yield (182)) gives bis-(5-chloro-2-hydroxyphenyl) sulfide [Beil. VI<sub>1</sub>-(396)], ndls. or lts. from  $C_6H_6$ , m.p. 175° (183), 174° (182), 173-174° (184), 173° (181) (corresp. dimethyl ether, m.p. 112° (182); diethyl ether, m.p. 145° (185), dibenzoate, m.p. 145° (182)); for use as disinfectant (181) (183) or in moth-proofing compositions (186) see indic. refs.]

[ $\bar{C}$  (2 moles) with  $SOCl_2$  (1 mole) +  $AlCl_3$  in  $CS_2$  gives (70% yield (184)) bis-(5-chloro-2-hydroxyphenyl) sulfoxide [Beil. VI<sub>1</sub>-(396)], pr. from dil. alc., m.p. 202° (corresp. dinitration prod., m.p. 180-181° (184)) ]

#### REACTIONS INVOLVING NUCLEAR HALOGEN OF $\bar{C}$

[ $\bar{C}$  on fusion with KOH (187) (188) or  $\bar{C}$  with aq. alkali or alk. carbonates in pres. of Cu or Cu compds. at elevated temp. under press. (189), or  $\bar{C}$  with aq.  $Ba(OH)_2$  nt 170-195° under press. (190), or  $\bar{C}$  with alkali or alk.-earth hydroxides + Cu salts at elevated temp. under press. (191) gives 1,4-dihydroxybenzene (hydroquinone) (1:1590); note, however, that in such fusions with alkali some 1,3-dihydroxybenzene (resorcinol) (1:1530) is also formed (187) (188) (192) (193), and  $\bar{C}$  (as Na $\bar{A}$ ) with NaOH at 310° for 5 hrs. gives (194) as high as 38% resorcinol (1:1530) + a trace of 2,4'-dihydroxybiphenyl; however,  $\bar{C}$  on fusion with  $K_2CO_3$  is claimed (193) to yield only hydroquinone (1:1590).]

[ $\bar{C}$  with  $Na_2S$  + NaOH nt 210-215° for 24 hrs. gives (195) 4-mercaptophenol (monothiohydroquinone) [Beil. VI-859, VI<sub>1</sub>-(410)], m.p. 29-30°]

[ $\bar{C}$  with  $NH_3$  in pres. of Cu cpds. htd. under press. gives (196) *p*-aminophenol;  $\bar{C}$  similarly with prim. aliphatic amines gives (196) corresp. *N*-alkyl-*p*-aminophenols.]

#### REACTIONS OF $\bar{C}$ INVOLVING PHENOLIC H (I.E., H OF THE OH GROUP)

Acidic strength.  $\bar{C}$  behaves as weak acid, is soluble in aq. alk. or in large excess (2.75 moles of 2 *N* (197)) aq.  $Na_2CO_3$  soln. from which it is reprecipitated by  $CO_2$  (197). — Dissoc. const. of  $\bar{C}$  in aq. at 28.5° =  $6.6 \times 10^{-10}$  (198); for studies of dissoc. const. in other solutions, e.g., in 50% MeOH at 20° (199) (200) or at 28.5° (198), or at 18° over range 0-95% MeOH by volume (203), in 30% aq. EtOH at 25° (200) (9) (201), or at 18° over range

0-95% EtOH by vol. (202), see indic. refs. — For hydrogen potential of  $\bar{C}$  in 48.95 vol. % EtOH or 95 vol. % EtOH at 20° see (204). — For titration of  $\bar{C}$  with standard NaOH and indicator see (205).

Salts of  $\bar{C}$ . (Na $\bar{A}$ ; from  $\bar{C}$  in nbs. EtOH with equiv. Na, evapd. under H<sub>2</sub>, dried at 140-150° (134); very hygroscopic ndls. from conc. alc. soln., turning brown in air; in contrast to Na phenolate is fairly eas. sol. dry ether (206); for behavior with CO<sub>2</sub> at 140-150° giving Na salt of 5-chlorosalicylic acid (3:4705) see (134) (135).]

[ $\bar{C}$  (38.4 pts.) with KOH (5.6 pts.) in C<sub>6</sub>H<sub>6</sub> gives (207) K $\bar{A}$ .2 $\bar{C}$ .]

[ $\bar{C}$  with AlCl<sub>3</sub> evolves heat and HCl giving (208) Cl.C<sub>6</sub>H<sub>4</sub>.OAlCl<sub>2</sub>, m.p. 185-187° (208).]

[For patents on use of alkali salts of  $\bar{C}$  as anti-gumming agents for motor fuels see (209); for use of aq. solns. of salts of  $\bar{C}$  as wash liquid for fuel gas purification see (210).]

#### ETHERIFICATION (see also below under $\bar{C}$ 's)

Aliphatic ethers of  $\bar{C}$ .  $\bar{C}$  with alkyl halides usually in presence of an acid acceptor gives the corresponding *p*-chlorophenyl ethers (e.g., for methyl ether (*p*-chloroanisole) (3:6300) or for ethyl ether (*p*-chlorophenetole) (3:0090) see these compds. — *p*-Chlorophenyl *n*-propyl ether appears to be unreported; for *p*-chlorophenyl isopropyl ether, h.p. 101° at 17 mm. (211), 73-75° nt 1.5 mm. (212),  $n_D^{25} = 1.5127$  (212), see indic. refs. — For *p*-chlorophenyl isobutyl ether, b.p. 95-97° at 3 mm.,  $n_D^{25} = 1.5090$ , see (213); the *n*-butyl, *sec*-butyl and *ter*-butyl ethers are unreported. — For *p*-chlorophenyl *n*-amyl ether, b.p. 132-133° at 12 mm., *p*-chlorophenyl *n*-heptyl ether, b.p. 172° at 34 mm., *p*-chlorophenyl *n*-heptyl ether, b.p. 162° at 14 mm., and *p*-chlorophenyl *n*-hexadecyl ether, m.p. 48°, see (214)].

[ $\bar{C}$  with vinyl chloride (3:7010) + aq. NaOH + CuCl<sub>2</sub> at 170-190° for 10 hrs. under press. gives (215) *p*-chlorophenyl vinyl ether, b.p. 193-194°,  $D_{20}^{20} = 1.138$ . —  $\bar{C}$  with allyl bromide + K<sub>2</sub>CO<sub>3</sub> in acetone gives (100% yield (216)) *p*-chlorophenyl allyl ether, h.p. 232-234° at ord. press., 106-107° at 12 mm.; note that distn. at ord. press. causes thermal rearr. to 4-chloro-2-allylphenol, b.p. 137° at 18 mm., 124-125° at 12 mm., m.p. 48° (corresp. *p*-nitrobenzoate, m.p. 82°) (216). —  $\bar{C}$  with methallyl chloride (3:7145) + K<sub>2</sub>CO<sub>3</sub> in acetone gives (217) *p*-chlorophenyl methylallyl ether, b.p. 101.5° at 8 mm.,  $D_{20}^{20} = 1.0979$ ,  $n_D^{20} = 1.5394$ ; this prod. on thermal rearr. gives (217) 4-chloro-2-methallylphenol, h.p. 113° at 8 mm.,  $D_{20}^{20} = 1.145$ ,  $n_D^{20} = 1.5622$ , accompanied by some 5-chloro-2,2-dimethylcoumaran, b.p. 96° at 5 mm.,  $D_{20}^{20} = 1.135$ ,  $n_D^{20} = 1.5300$  (217).]

[ $\bar{C}$  with ethylene oxide (1:6105) in alc. NaOEt adds giving (218) cf. (219) ethylene glycol mono-(*p*-chlorophenyl) ether (*p*-chlorophenyl  $\beta$ -hydroxyethyl ether), m.p. about 28° (corresp. *p*-nitrobenzoate, m.p. 90-91°) (218); note that the corresp. ethylene glycol bis-(*p*-chlorophenyl ether) is unreported.]

[ $\bar{C}$  (as Na $\bar{A}$ ) with 2-chloropropanol-1 (3:7917) gives (220) *p*-chlorophenyl  $\beta$ -hydroxyisopropyl ether (propylene glycol  $\beta$ -(*p*-chlorophenyl) ether), h.p. 151-153° at 18 mm. —  $\bar{C}$  with 3-chloropropanediol-1,2 (glycerol  $\alpha$ -monochlorohydrin) (3:9038) in alk. soln. (221), or  $\bar{C}$  with glycerol (1:6540) + NaOAc nt 200-210° in atmosphere of illuminating gas (222) gives *p*-chlorophenyl  $\beta,\gamma$ -dihydroxy-*n*-propyl ether (glycerol  $\alpha$ -(*p*-chlorophenyl) ether), cryst. from C<sub>6</sub>H<sub>6</sub>, m.p. 80° (221), 76° (222); b.p. 214-215° at 19 mm. (221), 173-175° at 17 mm. (223).]

[ $\bar{C}$  with diethyl chlorofumarate (3:6864) + NaOEt at 150° gives (224) diethyl *p*-chlorophenoxyfumarate, h.p. 199-200° at 12 mm. —  $\bar{C}$  (as Na $\bar{A}$ ) +  $\bar{C}$  with ethyl phenylpropiolate as directed gives (224) ethyl  $\beta$ -(*p*-chlorophenoxy)cinnamate, m.p. 63-64°, b.p. 220-225° at 12 mm.]

Aromatic ethers of  $\bar{C}$ . . . . . at 19 mm. (225), 146-150° at 7 mm. (226), . . . . . prod. has not been reported by etherification . . . . . (1:7125) in AcOH

with  $\text{Cl}_2$  (226), from K phenolate + *p*-chloriodobenzene (225), or from *p*-aminophenol phenyl ether via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reaction (226); for studies of its chlorination, bromination, iodination, and nitration see (226), for metalation see (227); note also that the product first reported (228) was impure (225).]

*p*-Chlorophenyl *p*-chlorophenyl ether (*bis*-(*p*-chlorophenyl) ether) [m.p.  $30^\circ$  (226) (229), b.p.  $168-172^\circ$  at 7 mm (226); note that this prod. has not been reported by etherification of  $\hat{\text{C}}$  but has been prepd. from diphenyl ether (1:7125) in AcOH with  $\text{Cl}_2$  (226), or from *p*-aminophenol *p*-chlorophenyl ether via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reaction (226) (229); for mononitration to 4-chlorophenyl 4-chloro-2-nitrophenyl ether, m.p.  $75^\circ$  (see also below) or dinitration to *bis*-(1-chloro-2-nitrophenyl) ether, m.p.  $152^\circ$  (229),  $154^\circ$  (230), see (229) (230)]

*p*-Chlorophenyl *o*-nitrophenyl ether [from  $\hat{\text{C}}$  (as  $\text{K}\hat{\text{A}}$ ) with *o*-chloronitrobenzene on htg (230) (231) in pres. of Cu bronze (232) (yields: 75% (232), 72% (230)), pale yel. cryst. from MeOH, m.p.  $46^\circ$  (231),  $45.5^\circ$  (230),  $44-45^\circ$  (232), b.p.  $220^\circ$  at 20 mm. (232),  $208^\circ$  at 11 mm. (232); note that this prod. does not (229) react with piperidine at  $100^\circ$ ]

*p*-Chlorophenyl *m*-nitrophenyl ether [m.p.  $60^\circ$  (233), reported only by indirect means (233)].  
*p*-Chlorophenyl *p*-nitrophenyl ether: from  $\hat{\text{C}}$  (as  $\text{K}\hat{\text{A}}$ ) with *p*-chloronitrobenzene on htg (81% yield (230)) (229) (233), m.p.  $76.5^\circ$  (230),  $76^\circ$  (233),  $75.5-76^\circ$  (229); b.p.  $215^\circ$  at 12 mm. (229) or as one prod. of nitration of *p*-chlorophenyl phenyl ether (above) (226) — [For pat. on use as insecticide see (131)]

*p*-Chlorophenyl 2,4-dinitrophenyl ether: from  $\hat{\text{C}}$  (as  $\text{K}\hat{\text{A}}$  (230) or  $\text{Na}\hat{\text{A}}$  (235)) with 2,4-dinitrochlorobenzene on htg (97% yield (230)); yel. tbls. from 1:2 EtOH/AcOH, m.p.  $126^\circ$  (235),  $123^\circ$  (230).

*p*-Chlorophenyl 2,4,6-trinitrophenyl ether [This prod. which should easily be obtd. from  $\hat{\text{C}}$  (as  $\text{K}\hat{\text{A}}$ ) with 2,4,6-trinitrochlorobenzene (picryl chloride) appears to be unreported.]

*p*-Chlorophenyl 4-chloro-2-nitrophenyl ether: from  $\hat{\text{C}}$  (as  $\text{K}\hat{\text{A}}$ ) with 2,5-dichloronitrobenzene on htg. (81.4% yield (230)) (229) (231) (81), pale yel. ndls. from alc., m.p.  $70^\circ$  (230),  $78^\circ$  (231),  $75^\circ$  (229); b.p.  $215-220^\circ$  at 15 mm (229)

*p*-Chlorophenyl 4-bromo-2-nitrophenyl ether: from  $\hat{\text{C}}$  (as  $\text{K}\hat{\text{A}}$ ) with 2,5-dibromonitrobenzene on htg. (91.0% yield (230)) (236), pale yel. ndls. from AcOH, m.p.  $100-101^\circ$  (236),  $100.5^\circ$  (230).

### ESTERIFICATION

Esters of inorganic acids. [ $\hat{\text{C}}$  with  $\text{SOCl}_2$  + pyridine in  $\text{C}_6\text{H}_6$  as directed gives (237) (238) *bis*-(*p*-chlorophenyl) sulfite, b.p.  $213-214^\circ$  at 12 mm., sl. dec.]

[ $\hat{\text{C}}$  (3 moles) with  $\text{PCl}_3$  (1 mole) at  $150^\circ$  gives (239) *tris*-(*p*-chlorophenyl) phosphite, m.p.  $49^\circ$ , b.p.  $290-297^\circ$  at 15 mm. (corresp. MeI addn. prod., m.p.  $71^\circ$  (239)), note, however, that  $\hat{\text{C}}$  with large excess  $\text{PCl}_3$  at  $100^\circ$  gives (210) *p*-chlorophenylphosphorous dichloride  $\text{Cl C}_6\text{H}_4\text{OPCl}_2$ , b.p.  $128-130^\circ$  at 12 mm., and di-(*p*-chlorophenyl)phosphorous chloride  $(\text{Cl C}_6\text{H}_4\text{O})_2\text{P}-\text{Cl}$ , b.p.  $225-227^\circ$  at 11 mm.]

[ $\hat{\text{C}}$  (3 moles) with  $\text{POCl}_3$  (1 mole) under reflux (211), or  $\hat{\text{C}}$  with  $\text{POCl}_3$  in cold alk. soln. (242) (213), or  $\hat{\text{C}}$  (as  $\text{Na}\hat{\text{A}}$ ) with  $\text{POCl}_3$  in neutral inert solv. (211), gives tri-(*p*-chlorophenyl) phosphate [Bd. VI-188, VI-(102)], m.p.  $117^\circ$  (211),  $112^\circ$  (211) — Note, however, that  $\hat{\text{C}}$  with  $\text{POCl}_3$  in pres. of Mg at  $130-140^\circ$  gives (215) *p*-chlorophenylphosphoryl dichloride,  $\text{Cl C}_6\text{H}_4\text{O}-\text{P}(\text{O})\text{Cl}_2$  [Bd. VI-188, VI-(102)], b.p.  $263^\circ$  at 760 mm. (216) (217),  $141^\circ$  at 12 mm. (216),  $95-115^\circ$  at 0.1 mm. (215), accompanied by di-(*p*-chlorophenyl)phosphoryl chloride  $(\text{Cl C}_6\text{H}_4\text{O})_2\text{P}(\text{O})\text{Cl}$  [Bd. VI-188], b.p.  $161-176^\circ$  at 0.1 mm. (215); these two products are highly hydrolyzed, respectively, to *p*-chlorophenylphosphonic acid [Bd. VI-188] cf. (218), m.p.  $80-81^\circ$  (219), and di-(*p*-chlorophenyl)phosphoric acid [Bd. VI-188], m.p.  $126-127^\circ$  (212),  $133-135^\circ$  cor. (218) (220).]

[For analogous behavior of  $\bar{C}$  with  $TiCl_4$  see (251).]

Esters of aliphatic organic acids (see also below under  $\textcircled{D}$ 's).

*p*-Chlorophenyl acetate: from  $\bar{C}$  with  $Ac_2O + NaOAc$  (252); m.p. 7–8° (252), h.p. 226–228° (253), 100–102° at 15 mm. (254), 108° at 12.5 mm. (252), 90–92° at 2.5 mm. (61),  $D_4^{20} = 1.2248$  (252). — Note that this prod. with  $AlCl_3$  on htg. (255) (254) (61) or  $\bar{C}$  with  $AcCl + FeCl_3$  directly (256) gives (100% yield (255)) 4-chloro-2-acetylphenol (5-chloro-2-hydroxyacetophenone) [Beil. VIII-86], m.p. 55° (256), 54° (61), 63.5–54.6° (167), b.p. 97–99° at 2 mm. (61) (corresp. acetate, b.p. 156–157° (140)).

*p*-Chlorophenyl propionate: from  $\bar{C}$  with propionyl chloride (3:7170) (140) (61); oil, h.p. 234–236° (140), 76–78° at 2 mm. (61). — Note that this prod. with  $AlCl_3$  undergoes Fries rearr. giving (140) (61) 4-chloro-2-propionylphenol (5-chloro-2-hydroxypropionophenone), m.p. 59.7° (61), 56.5–57.5° (140) (corresp. methyl ether, m.p. 41–42°, b.p. 135–140° at 6 mm. (257)).

*p*-Chlorophenyl *n*-butyrate: from  $\bar{C}$  with *n*-butyryl chloride (3:7370) (140) (61); oil, b.p. 249–251° (140), 96–98° at 3 mm. (61). — Note that this prod. with  $AlCl_3$  undergoes Fries rearr. giving (140) (61) 4-chloro-2-(*n*-butyryl)phenol (5-chloro-2-hydroxy-*n*-butyropenone), m.p. 50.5° (61), 49–50° (140); h.p. 108–112° at 3 mm. (61).

*p*-Chlorophenyl isobutyrate: from  $\bar{C}$  with isobutyric acid (1:1030) +  $POCl_3$  (258); m.p. 29°, b.p. 120° at 11 mm. (258). — Note that this prod. with  $AlCl_3$  undergoes Fries rearr. giving (258) 4-chloro-2-isobutyrylphenol (5-chloro-2-hydroxy-isobutyropenone), oil, h.p. 130° at 20 mm.,  $D_4^{20} = 1.192$ ,  $n_D^{20} = 1.5521$  (258).

[For generally analogous behavior of  $\bar{C}$  with *n*-valeryl chloride (3:7740), *n*-caproyl chloride (3:8168), *n*-heptanoyl chloride (3:8520), *n*-octanoyl chloride (3:8680) see (61); with chloroacetyl chloride (3:5235) see (259); with  $\alpha$ -bromo-isovaleryl bromide see (260).]

$\bar{C}$  (as  $Na\bar{A}$ ) (2 moles) with  $COCl_2$  (3:5000) in  $C_6H_6$  at 130–180° under press. (261) or  $\bar{C}$  (as  $K\bar{A}$ ) in conc. aq. soln. with  $COCl_2$  in toluene (262), or  $\bar{C}$  with trichloromethyl chloroformate (dipsogenc) (3:5515) + aq.  $NaOH$  (263), gives di-(*p*-chlorophenyl) carbonate [Beil. VI-187], m.p. 147° (263), 144–145° (264).

Esters of aromatic organic acids (see also below under  $\textcircled{D}$ 's).

*p*-Chlorophenyl benzoate: from  $\bar{C}$  with benzoyl chloride (3:6240) (265) (for study of rate at 25° see (268)) in pres. of aq.  $NaOH$  (252) (266) (267); m.p. 87–87.5° (138), 87° u.c. (252), 86° (266) (267) — Note that this prod. with  $AlCl_3$  undergoes Fries rearr. giving (140) 4-chloro-2-benzoylphenol (5-chloro-2-hydroxybenzophenone), m.p. 95.0–95.5° (138), 94–95° (139), 94° (137), 93–94° (140) (corresp. benzoate, m.p. 112° (139)).

*p*-Chlorophenyl cinnamate: from  $\bar{C}$  with cinnamoyl chloride (3:0330) (68% yield (260)), m.p. 105° (260) (269).

— *p*-Chlorophenyl methyl ether (*p*-chloroanisole): oil. (See 3:6300.)

— *p*-Chlorophenyl ethyl ether (*p*-chlorophenetole): m.p. 20–21°. (See 3:0090.)

— *p*-Chlorophenyl acetate: m.p. 7–8° (252). [For further details see above under esters of  $\bar{C}$  with aliphatic organic acids.]

① *p*-Chlorophenyl benzoate: m.p. 87.0–87.5° (138), 87° u.c. (252), 86° (266) (267) [From  $\bar{C}$  with benzoyl chloride in pres. of aq.  $NaOH$  (252) (266) (267) (see also above under esters of  $\bar{C}$  with aromatic organic acids).]

— *p*-Chlorophenyl *o*-nitrobenzoate: unreported.

② *p*-Chlorophenyl *m*-nitrobenzoate: m.p. 124.5° (252). [From  $\bar{C}$  with *m*-nitrobenzoyl chloride + aq.  $NaOH$  (252).]

③ *p*-Chlorophenyl *p*-nitrobenzoate: m.p. 171° (270).

④ *p*-Chlorophenyl 3,5-dinitrobenzoate: m.p. 186° (271).

— *p*-Chlorophenyl benzenesulfonate: unreported.

— *p*-Chlorophenyl *p*-toluenesulfonate: unreported.

⑥ *p*-Chlorophenyl benzyl ether: ndls. from alc., m.p. 71° (272), 70–71° (273). [Note, however, that  $\bar{C}$  with benzyl chloride (3:8535) +  $AlCl_3$  gives not only this prod. but also (273) cf. (274) some Fries rearr. prod., viz., 4-chloro-2-benzylphenol (5-chloro-2-hydroxydiphenylmethane), m.p. 48–49° (273), 48.5° (274) (corresp. benzoate, m.p. 54–55°, benzenesulfonate, m.p. 68–69°, *p*-toluenesulfonate, m.p. 75.0–75.5° (273)).]

⑦ *p*-Chlorophenyl *p*-nitrobenzyl ether: cryst. from alc., m.p. 101.3° (275). [From  $\bar{C}$  + *p*-nitrobenzyl chloride (m.p. 71°) (or *p*-nitrobenzyl bromide, m.p. 99°) in alc. NaOEt (275).]

⑧ *p*-Chlorophenyl 2,4-dinitrophenyl ether: yel. thls. from 1:2 EtOH/AcOH, m.p. 126° (235), 123° (230). [From  $\bar{C}$  (as  $K\bar{A}$  (230) or  $Na\bar{A}$  (235)) with 2,4-dinitrochlorobenzene (m.p. 51°) on htg. (97% yield (230))]

⑨ *p*-Chlorophenoxyacetic acid (3.4375): pr. from hot aq., m.p. 156.7–157.2° cor. (279), 155–156.5° u.c. (276), 155–156° (277), 154–155° (278). [From  $\bar{C}$  with chloroacetic acid in aq. alk (279) (276) (277) (278)]

— *p*-Chlorophenyl *N*-phenylcarbamate: cryst. from alc., m.p. 138° (280), 137–138° (263). [From  $\bar{C}$  (as  $Na\bar{A}$ ) with phenylisocyanide dichloride on htg. (280); note, however, prepn. from  $\bar{C}$  + phenyl isocyanate has not been reported.]

⑩ *p*-Chlorophenyl *N*-(*p*-bromophenyl)carbamate: white pl. from  $C_6H_6$ /EtOAc, m.p. 196–197° cor. (281). [From  $\bar{C}$  with *p*-bromobenzazide (281) in lgr. (281).]

⑪ *p*-Chlorophenyl *N*-(*p*-iodophenyl)carbamate: m.p. 214–215° (282). [From  $\bar{C}$  with *p*-iodobenzazide (282) in lgr. (282)]

⑫ *p*-Chlorophenyl *N*-(*m*-nitrophenyl)carbamate: white pl. from lgr., m.p. 136° u.c., 139° cor. (283). [From  $\bar{C}$  with *m*-nitrobenzazide (283) or *m*-nitrophenyl isocyanate (283) in lgr. (283)]

⑬ *p*-Chlorophenyl *N*-(*p*-nitrophenyl)carbamate: pale yel. rods from lgr., m.p. 106° cor. (284). [From  $\bar{C}$  with *p*-nitrobenzazide (284) in lgr. (284).]

⑭ *p*-Chlorophenyl *N*-(3,6-dinitrophenyl)carbamate: yel. pl. from  $C_6H_6$ /EtOAc, m.p. 197–198° (285). [From  $\bar{C}$  with 3,5-dinitrobenzazide (285) in lgr. (285).]

⑮ *p*-Chlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate: pale yel. pl. from lgr., m.p. 206–207° u.c., 212–213° cor. (286). [From  $\bar{C}$  with 3,5-dinitro-4-methylbenzazide (286) in lgr. (286)]

⑯ *p*-Chlorophenyl *N*-( $\alpha$ -naphthyl)carbamate: m.p. 165–166° (287). [From  $\bar{C}$  with  $\alpha$ -naphthyl isocyanate in lgr. (287).]

⑰ *p*-Chlorophenyl *N*-( $\beta$ -naphthyl)carbamate: pl. from lgr., m.p. 165–166° u.c., 169–170° cor. (288). [From  $\bar{C}$  with  $\beta$ -naphthyl isocyanate (288) in lgr. (288).]

⑱ *p*-Chlorophenyl *N,N*-diphenylcarbamate: m.p. 97° (289). [From  $\bar{C}$  with *N,N*-diphenylcarbamyl chloride (289)]

## 3:0525 16-CHLOROHEXADECANOL-1

 $C_{16}H_{33}OCl$ 

Beil. S.N. 24

( $\omega$ -Chloro-*n*-hexadecyl alcohol;  
 $\omega$ -Chloropalmityl alcohol)

M.P. 43° (1)

Colorless cryst. from lt. pet.

[For prepn. of  $\bar{C}$  from  $\alpha, \omega$ -hexadecamethylene glycol [Beil. I<sub>2</sub>-(565)] (m.p. 87-88° (1)) with  $\text{SOCl}_2$  + dimethylaniline in  $\text{C}_6\text{H}_6$  (60% yield) see (1); note that a little 1,16-dichlorohexadecane, cryst. from MeOH, m.p. 47°, is also formed.]

3:0525 (1) Bennett, Gudgeon, *J. Chem. Soc.* 1933, 1679-1681.3:0535 METHYL *p*-CHLOROBENZOATE $\text{C}_8\text{H}_7\text{O}_2\text{Cl}$ 

Beil. IX - 340

IX<sub>1</sub>-

M.P. 44° (1)

43-43.5° (2) (6)

43° (3) (4)

42° (5)

34° (9)

[For prepn. of  $\bar{C}$  from *p*-chlorobenzoic acid (3:4940) with MeOH + HCl (2) or MeOH +  $\text{H}_2\text{SO}_4$  (2) (6) see indic. refs.; from  $\text{Ag}\bar{A}$  + MeI in s.t. at 100° see (5); from *p*-chlorobenzoyl chloride (3:6350) with MeOH see (3).]

$\bar{C}$  on htg. with sirupy  $\text{H}_3\text{PO}_4$  at 200° yields (7) *p*-chlorobenzoic acid (3:4940), dimethyl ether, and probably some *p*-chlorotoluene (3:8287).

$\bar{C}$  added to 5-6 pts. very conc.  $\text{HNO}_3$  at 0°, poured onto ice, yields (3) methyl 4-chloro-3-nitrobenzoate [Beil. IX-402], cryst. from MeOH, m.p. 83° (3).

[ $\bar{C}$  with Na + methyl acetate condenses giving (60% yield (6)) methyl *p*-chlorobenzoyl-acetate, b.p. 172° at 12 mm., m.p. 36-37° (6); this prod. with excess phenylhydrazine in alc. + AcOH gives on htg. 3-(*p*-chlorophenyl)-1-phenylpyrazolone-5, or. cryst. from AcOH, m.p. 140° (6); corresp. prod. from *p*-nitrophenylhydrazine, m.p. 200-205° (6).]

$\bar{C}$  on hydrolysis (Sap. Eq. = 170.5) yields methyl alcohol (1:6120) + *p*-chlorobenzoic acid (3:4940). [For studies of hydrolysis under various cond. see (2) (4).] — For the amide, anilide, *p*-toluidide, and other deriva. corresp. to  $\bar{C}$  see *p*-chlorobenzoic acid (3:4940).

## 3:0550 3,4-DICHLOROBENZALDEHYDE

 $\text{C}_7\text{H}_4\text{OCl}_2$ 

Beil. VII - 238

VII<sub>1</sub>-(134)

M.P. 44° (1) B.P. 247-248° (2)

43-44° (2)

42.0-42.6° (3)

Colorless ndls. from alc. (1), odor like benzaldehyde (2). — Eas. volatile with steam (2) (3).

[For prepn. of  $\bar{C}$  from 3,4-dichlorotoluene (3:6355) via chlorination to 3,4-dichlorobenzal

(di)chloride (3:6876) and hydrolysis of the latter with fuming  $\text{H}_2\text{SO}_4$  (5%  $\text{SO}_2$ ) (36% yield (3)), conc.  $\text{H}_2\text{SO}_4$  (4), or  $\text{CaCO}_3 + \text{H}_2\text{O}$  (40% yield (3)) see (2) (3) (4); for prepn. from 4-chloro-3-nitrobenzaldehyde via reduction, diazotization, etc., see (1).]

$\bar{\text{C}}$  with satd. aq.  $\text{NaHSO}_3$  yields a cpd  $\bar{\text{C}}\text{NaHSO}_3$  (3). [Use in purification of  $\bar{\text{C}}$  (3).]  
 $\bar{\text{C}}$  on oxdn. with  $\text{KMnO}_4$  yields (2) 3,4-dichlorobenzoic acid (3:4925), m.p. 201–202° (3).  
 —  $\bar{\text{C}}$  with conc. aq.  $\text{KOH}$  undergoes Cannizzaro reactn. yielding 3,4-dichlorobenzyl alcohol, ndls. from aq., m.p. 38° (3), and 3,4-dichlorobenzoic acid (see above).

$\bar{\text{C}}$  on nitration as specified (5) (4) gives (71% yield (4)) 3,4-dichloro-6-nitrobenzaldehyde [Beil. VII-1(144)], yel. pr. from  $\text{C}_6\text{H}_6$ , m.p. 73° (5). [This product with  $\text{NH}_4\text{OH}/\text{AgNO}_3$  is oxidized (4) to 3,4-dichloro-6-nitrobenzoic acid, cryst. from  $\text{C}_6\text{H}_6$ , m.p. 165° (6).]

[For conversion of  $\bar{\text{C}}$  to 3,4-dichlorostyrene (7) (8) cf. (9) via reaction with  $\text{MeMgI}$  giving (73% yield (7)) 3,4-dichlorophenyl-methyl-carbinol (7) (8) and dehydration of latter with  $\text{KHSO}_4$  (yields 83% (8), 64% (7)) see indic. refs.]

Ⓒ 3,4-Dichlorobenzaldoxime (*anti* form): m.p. 114–115° (2), 118–119° (1). [The *syn* isomer, ndls. from alc., m.p. 120° rap. htg., is converted by fusion (2) to the *anti* form.]

— 3,4-Dichlorobenzaldehyde phenylhydrazone: unrecorded.

Ⓓ 3,4-Dichlorobenzaldehyde *p*-nitrophenylhydrazone: or. ndls., m.p. 276–277° (1).

— 3,4-Dichlorobenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.

— 3,4-Dichlorobenzaldehyde semicarbazone: unrecorded.

### 3:0560 2,4-DICHLOROPHENOL

 $\text{C}_6\text{H}_4\text{OCl}_2$ 

Beil. VI - 189

VI-1(103)

VI-1(178)

M.P.		B.P.		
45°	(1) (2)	210.2–211.5° u.c.	(18)	$D_{25}^{25} = 1.4723$ (8)
43–44°	(17)	209–211°	(6) (11)	$n_D^{25} = 1.1729$ (8)
43°	(3) (4)	209–210°	(4)	
	(16) (18)	206–208° u.c. at 763 mm.	(7)	
42°	(5)	106.2–107.6° at 14–16 mm.	(3)	
41–42°	(11)			

Colorless ndls. from  $\text{C}_6\text{H}_6$ . —  $\bar{\text{C}}$  has unpleasant and persistent odor suggesting iodoform (1) (for study of strength of odor of aq. solns. of  $\bar{\text{C}}$  see (1)). —  $\bar{\text{C}}$  is spar. sol. aq. (100 g. aq. at 20° dis. 0.45 g.  $\bar{\text{C}}$ ), but is eas. sol. alc. ether,  $\text{C}_6\text{H}_6$ , or  $\text{CHCl}_3$ . —  $\bar{\text{C}}$  is volatile with steam; note, however, that from alk. soln.  $\bar{\text{C}}$  is not volatile with steam (dif. and sepn. from 2-chlorophenol (3:5980) or 4-chlorophenol (3:0475) (9)), although  $\bar{\text{C}}$  is volatile with steam from aq. solns. contg.  $\text{PbCO}_3$  (dif. and sepn. of  $\bar{\text{C}}$  from 2,4,6-trichlorophenol (3:1673) (9)). — Note that comm.  $\bar{\text{C}}$  often contains 2,4,6-trichlorophenol, and that  $\bar{\text{C}}$  prepd. by chlorination of phenol may cont. 2,6-dichlorophenol (3:1593).

[For prepn. of  $\bar{\text{C}}$  from *p*-chlorophenol (3:0475) or *o*-chlorophenol (3:5980) with  $\text{Cl}_2$  (1 mole) in  $\text{AcOH}$  soln. (80% yield) see (6); from phenol (1:1420) with  $\text{Cl}_2$  (2 moles) diluted with  $\text{CO}_2$  in  $\text{AcOH}$  and under these cond. giving exclusively  $\bar{\text{C}}$  see (7).]

[For formn. of  $\bar{C}$  (together with other prods.) from phenol (1:1420) with  $Cl_2$  (2 moles) (2) (1) (4) (10), with  $Cl_2$  (2 moles) in alk. soln. (11) (12), with *N,N'*-dichlorourea in HCl soln. (13), or with  $SO_2Cl_2$  (14) see indie. refs.; for formn. of  $\bar{C}$  from salicylic acid (1:0780) in excess aq. KOH with  $Cl_2$  see (15); from 3,5-dichloro-2-hydroxybenzoic acid (3,5-dichlorosalicylic acid) (3:4935) on distn. with lime see (16) (17); from 2,6-dichloro-3-hydroxybenzaldehyde (3:4160) in excess 50% aq. KOH on htg. at  $80^\circ$  (94% yield) see (5).]

Nuclear substitution of  $\bar{C}$ .  $\bar{C}$  in AcOH with  $Br_2$  (1 mole) (7) (18), or in 50% AcOH with  $Br_2$  (1 mole) in AcOH (19), yields 6-bromo-2,4-dichlorophenol, ndls. from  $C_6H_6$  or lt. pet., m.p.  $68-69^\circ$  (19),  $68^\circ$  (7) (18), h.p.  $268^\circ$  dec. (18),  $204^\circ$  at 19 mm. (19),  $198^\circ$  at 15 mm. (19),  $192^\circ$  at 12 mm. (19) (corresp. methyl ether, m.p.  $65^\circ$  (7); corresp. 2,4-dinitrophenyl ether, yel. lfts. from alc., m.p.  $140-141^\circ$  (19); corresp. *p*-toluenesulfonate, m.p.  $82-83^\circ$  (19)). — [This 6-bromo-2,4-dichlorophenol with excess  $Br_2$  in pres. of Fe powder and absence of aq. yields (20) 2,4-dichloro-3,5,6-tribromophenol, cryst. from AcOH, m.p.  $209^\circ$  (20) (corresp. methyl ether, m.p.  $143-144^\circ$  (20), corresp. benzoate, m.p.  $202^\circ$  (20)).]

$\bar{C}$  in aq. NaOH with  $I_2$  (1 mole) in aq. KI yields (7) 2,4-dichloro-6-iodophenol, ndls. from dil. alc., m.p.  $63^\circ$  (7) (corresp. methyl ether, m.p.  $35^\circ$ , h.p.  $278-285^\circ$  u.c. (7)).

$\bar{C}$  on nitration by soln. in cold fuming  $HNO_3$ , subsequently poured into aq. (4) cf. (21), yields 2,4-dichloro-6-nitrophenol [Beil. VI-241, VI-(122)], yel. cryst. from alc., m.p.  $121-122^\circ$  (4),  $124^\circ$  (22).

Condensation reactions involving nuclear hydrogens. [ $\bar{C}$  with formalin (1:0145) + conc. HCl + conc.  $H_2SO_4$  in pres. of stream of HCl gas at  $35-40^\circ$  (23), or  $\bar{C}$  with trioxymethylene + AcOH/ $H_2SO_4$  at  $50^\circ$  (24), gives (54% yield (23)) 6,8-dichlorobenzodioxane-1,3, volatile with steam, cryst. from MeOH, m.p.  $111^\circ$  (24),  $109-109.5^\circ$  (23). —  $\bar{C}$  with formalin (1:0145) + conc. HCl in stream of HCl gas at  $50^\circ$  for 36 hrs. gives (72% yield (23)) 3,5-dichloro-2-hydroxybenzyl chloride, ndls. from pet. eth., m.p.  $82-84^\circ$  (23); this prod. on hydrol. with aq. at  $50^\circ$  yields (23) 3,5-dichloro-2-hydroxybenzyl alc., ndls. from aq., m.p.  $80-81^\circ$ , also formed as hy-product of the dichlorobenzodioxane mentioned above.]

[ $\bar{C}$  with methylal (1:0105), methylene diacetate, or methylene (di)iodide in pres. of conc.  $H_2SO_4$  or  $ZnCl_2$  (25) or  $\bar{C}$  + formalin (1:0145) with AcOH/ $H_2SO_4$  (26) yields methylene-*bis*-(2,4-dichlorophenol) (2,2'-dihydroxy-3,5,3',5'-tetrachlorodiphenylmethane); for use of this prod. as mothproofing cpd., antiseptic, and seed disinfectant see (25) (26) (27) (28) (29) (30). — Note, however, that  $\bar{C}$  (as Na salt) with methylene (di)chloride (3:5020) at  $120-140^\circ$  in s.t. for 6 hrs. gives (24) *bis*-(2,4-dichlorophenoxy)methane, m.p.  $98^\circ$ . —  $\bar{C}$  with  $SCl_2$  or  $S_2Cl_2$  +  $AlCl_3$  in  $CS_2$  or  $CCl_4$  yields (31) 2,2'-dihydroxy-3,5,3',5'-tetrachlorodiphenyl sulfide, m.p.  $188^\circ$ . — For condens. of  $\bar{C}$  with benzaldehyde *o*- (or *p*-) sulfonic acids and use of products as mothproofing agts. see e.g. (26).]

[ $\bar{C}$  with phthalic anhydride (1:0725) +  $AlCl_3$  at  $150^\circ$  for 2 hrs. yields (36) cf. (37) (38) 2-(3',5'-dichloro-2'-hydroxybenzoyl)benzoic acid, colorless lfts. from alc., m.p.  $204^\circ$  cor. (36), which with conc.  $H_2SO_4$  ring-closes to 2,4-dichloro-1-hydroxyanthraquinone, yel. ndls. from  $C_6H_6$ , m.p.  $242^\circ$  (36),  $241-242^\circ$  (39). —  $\bar{C}$  with 4,5-dichlorophthalic anhydride (3:4830) + fuming  $H_2SO_4$  +  $H_3BO_3$  at  $195^\circ$  yields (40) 2,6,7-trichloro-1,4-dihydroxyanthraquinone (2,6,7-trichloroquinizarin).]

Reactions of the phenolic group of  $\bar{C}$  (see also under  $\bar{D}$  below).  $\bar{C}$  behaves as a weak acid:  $\bar{C}$  is sol. in aq. alk. but largely pptd. by  $CO_2$ . — Dissoc. const. at  $25^\circ$  in aq. is  $31. \times 10^{-7}$  (41) cf. (42).

[For study of bactericidal prop. of  $\bar{C}$  see (43); for use as insecticide in paper see (44); for prepn. and use of metal complexes as antiseptics see (45).]

[ $\bar{C}$  with alkali metals gives corresp. alk. 2,4-dichlorophenolates: K 2,4-dichlorophenolate with  $CO_2$  at  $140^\circ$  yields (15) 3,5-dichloro-2-hydroxybenzoic acid (3,5-dichlorosalicylic acid) (3:4935).]

[ $\bar{C}$  with ethyl  $\alpha$ -methylacetoacetate (1:1712) +  $P_2O_5$  gives (14.5% yield (46)) 6,8-dichloro-2,3-dimethylchromone (Beil. XVII-1-177)], ndls. from alc., m p. 141°.]

[ $\bar{C}$  in 20% aq. KOH htd. 2 hrs. at 100° with  $Me_2SO_4$  (22) cf. (1) yields 2,4-dichlorophenyl methyl ether (2,4-dichloroanisole) [Beil. VI-189, VI-1-103]], b.p. 232-233° cor. at 743.5 mm.; m.p. 27-28° (47). —  $\bar{C}$  with  $EtI$  +  $K_2CO_3$  in acetone refluxed 6-8 hrs. gives (90% yield (48)) 2,4-dichlorophenyl ethyl ether (2,4-dichlorophenetole), oil, b.p. 235-236° (48), 236-237° (4) (for study of cleavage of this ether with  $HBr/AcOH$  see (48), for study of rate of formation see (49)). —  $\bar{C}$  with allyl bromide +  $K_2CO_3$  in acetone yields (50) allyl 2,4-dichlorophenyl ether, b.p. 144-145° at 25 mm. (50).]

— 2,4-Dichlorophenyl acetate: oil, b.p. 241-245° (4), 167-168° at 80 mm. (51). [From  $\bar{C}$  with  $AcCl$  refluxed 40 min. (86% yield (51)), this ester with  $AlCl_3$  at 170° for 40 min. undergoes Fries rearr. giving (75% yield (51)) 3,5-dichloro-2-hydroxyacetophenone, m.p. 95-96° (51).]

⑤ 2,4-Dichlorophenyl benzoate: cryst. from alc., m.p. 96.5° (5), 96° (1), 97° [Beil. IX-117]. [From  $\bar{C}$  in dil. aq. NaOH shaken with  $BzCl$  (5) cf. (1)] [For study of nitration of this ester see (6).]

⑥ 2,4-Dichlorophenyl *m*-nitrobenzoate: ndls. from alc., m.p. 115-116° (6). [From  $\bar{C}$  + *m*-nitrobenzoyl chloride in dil. aq. alk.; for study of its nitration see (6).]

— 2,4-Dichlorophenyl *p*-nitrobenzoate: unreported.

— 2,4-Dichlorophenyl 3,6-dinitrobenzoate: unreported.

— 2,4-Dichlorophenyl benzenesulfonate: unreported.

\* ⑦ 2,4-Dichlorophenyl *p*-toluenesulfonate: pr. from alc., m.p. 125° (6).

⑧ 2,4-Dichlorophenyl benzyl ether: pr. from alc., ether, or pet. eth., m.p. 62° (52), 61-62° (53), 60° (54), 59.0-59.5° (55). [From  $\bar{C}$  + benzyl chloride (3:8335) +  $NaOEt$  in hot alc. (53), or from Na salt of  $\bar{C}$  + benzyl chloride in  $MeOH$  (55); note, however, that Na salt of  $\bar{C}$  with benzyl chloride in toluene at 160° for 5 hrs. undergoes instead nuclear alkylation yielding (55) 2,4-dichloro-6-benzylphenol (3,5-dichloro-2-hydroxydiphenylmethane), cryst. from pet. eth., m.p. 77.0-77.5° (55).]

⑨ 2,4-Dichlorophenyl *p*-nitrobenzyl ether: ndls. from ether, m.p. 148-150° (53).

⑩ 2,4-Dichlorophenyl 2,4-dinitrophenyl ether: lfts. from  $AcOH$ ,  $AcOH/EtOH$ , or  $EtOH$ , m.p. 119° (56), 118-119° (6), 118° (57). [From Na or K salt of  $\bar{C}$  + 2,4-dinitrochlorobenzene refluxed in alc. (56) (6) (57).]

⑪ 2,4-Dichlorophenoxyacetic acid (3:4095): cryst. from  $C_6H_6$ , m.p. 138° (58), Neut. Eq. = 221.0. [From  $\bar{C}$  + chloroacetic acid in slight excess aq. NaOH, refluxed and then acidified (87% yield (58)); for studies on use of this prod. as plant hormone see (59).]

— 2,4-Dichlorophenyl *N*-phenylcarbamate: unreported.

⑫ 2,4-Dichlorophenyl *N*-(*p*-iodophenyl)carbamate: m.p. 182-183° (61). [From  $\bar{C}$  + *p*-iodobenzazide in hot lgr (61).]

⑬ 2,4-Dichlorophenyl *N*-(*p*-bromophenyl)carbamate: rods from lgr/ $AcOEt$ , m.p. 169° cor. (62) [From  $\bar{C}$  + *p*-bromobenzazide in hot lgr. (62).]

⑭ 2,4-Dichlorophenyl *N*-(*p*-nitrophenyl)carbamate: yel. pl. from lgr./ $EtOAc$ , m.p. 205° cor. (62). [From  $\bar{C}$  + *p*-nitrobenzazide in hot lgr. (63).]

⑮ 2,4-Dichlorophenyl *N*-(3,5-dinitro-4-methylphenyl)carbamate: or.-yel. pr. from lgr. or  $EtOAc$ , m.p. 153° u.c., 157° cor. (64). [From  $\bar{C}$  + 3,5-dinitro-4-methylbenzazide in hot lgr (64).]

— 2,4-Dichlorophenyl *N*-( $\alpha$ -naphthyl)carbamate: unreported.

⑯ 2,4-Dichlorophenyl *N*-( $\beta$ -naphthyl)carbamate: pl. from lgr., m.p. 162° u.c., 166° cor. (65). [From  $\bar{C}$  +  $\beta$ -naphthyl isocyanate (or azide) in hot lgr. (65).]

similarly. —  $\bar{C}$  (1 mole) with salicylic acid (I:0780) in pyridine at  $-15^{\circ}$  (52) or in  $C_6H_6$  with dimethylaniline (63% yield (52)) gives *O*-carbethoxysalicylic acid [Beil. X-69, XI-(30)], m.p.  $95^{\circ}$  (other mono-, di-, and polyhydroxy phenolic acids behave similarly); since the carbethoxy groups so introduced may subsequently be removed by hydrolysis, this process has great value as a means of temporary blocking of phenolic groups (for further discussion and many references see (53)).]

[ $\bar{C}$  also reacts with the sodio derivatives and other metallic enolates: e.g.,  $\bar{C}$  (1 mole) with ethyl cyanoacetate (2 moles) in abs. alc. + NaOEt (2 moles) gives (54) diethyl cyanomalonate [Beil. II-S11, II<sub>1</sub>-(321), II<sub>2</sub>-(680)], b.p.  $135-140^{\circ}$  at 14 mm.,  $D_4^{20} = 1.128$ ,  $n_D^{20} = 1.4295$  (55). —  $\bar{C}$  with diethyl malonate (I:3581) + NaOEt in alc. (56) or  $\bar{C}$  with dry diethyl sodio-malonate (57) directly (58) (59) or in  $C_6H_6$  refluxed for 10 hrs. (60) gives (yields: 50-80% (59), 60-65% (60)) triethyl methane-tricarboxylate (tricarbethoxymethane) [Beil. II-S10, II<sub>1</sub>-(320), II<sub>2</sub>-(680)], m.p.  $29^{\circ}$ , h.p.  $253^{\circ}$ ; note that this same prod. is also obtained (yields: 88-93% (61), 90% (62), 80% (63)) from  $\bar{C}$  with diethyl malonate (I:3581) in abs. alc. with Mg + trace  $CCl_4$ . —  $\bar{C}$  with the Na enolate of ethyl isobutyrate (I:3095) gives (75% yield (64)) diethyl dimethylmalonate (Beil. II-648, II<sub>1</sub>-(276), II<sub>2</sub>-(572)], b.p.  $195-196^{\circ}$  at 760 mm. — The reactn. of  $\bar{C}$  with ethyl sodioacetoacetate cannot be discussed here.]

[ $\bar{C}$  with excess RMgX compounds presumably gives first the corresp. esters which by further normal reactn. with more RMgX are converted to tertiary alcohols: e.g.,  $\bar{C}$  with EtMgBr (excess) yields (65) triethylcarbinol (I:6218); however, the intermediate ester can often readily be obtd.; e.g.,  $\bar{C}$  (1 mole) with *tert*-BuMgCl (1 mole) in dry ether gives (56% yield (66)) ethyl trimethylacetate (ethyl pivalate (I:3117), and other cases are recorded (66)); note, however, that with certain types of RMgX cpd. abnormal reactions can occur: e.g.,  $\bar{C}$  with benzyl MgCl yields not only the normal tribenzylcarbinol but also (67) ethyl *o*-toluate (I:3862). —  $\bar{C}$  also reacts with the  $=N-MgX$  grouping replacing  $-MgX$  by  $-COOEt$  (sometimes followed by rearrangement): e.g.,  $\bar{C}$  + 3,5-dimethylpyrrole-*N*-(magnesium bromide) gives (57-58% yield (68)) 5-carbethoxy-2,4-dimethylpyrrole.]

$\bar{C}$  also reacts readily with  $NH_3$ , with primary and secondary amines, with amino acids, etc., to replace one of the H's attached to N by the  $-COOEt$  group (see also below and under ⑥): e.g.,  $\bar{C}$  with excess conc. aq.  $NH_4OH$  immediately (if delayed, urea is formed) evaporated to dryness gives (3) ethyl carbamate (urethane) (Beil. III-22, III<sub>1</sub>-(9), III<sub>2</sub>-(19)], very eas. sol. aq., cryst. from abs. alc., dry ether,  $CHCl_3$ , or  $C_6H_6$ , m.p.  $48^{\circ}$ , b.p.  $184^{\circ}$ . — [ $\bar{C}$  (1 mole) in ether with 33% aq.  $MeNH_2$  soln. (1 mole) + aq. NaOH below  $5^{\circ}$  as directed (69) gives (88-90% yield (69)) (70) (71) ethyl *N*-methylcarbamate [Beil. IV-64, IV<sub>1</sub>-(330), IV<sub>2</sub>-(567)], oil, very sol. aq. (69 g. in 100 ml. aq. nt  $15.5^{\circ}$  (72)), b.p.  $170^{\circ}$ . — Countless other, analogous reactns. cannot be cited here.]

[ $\bar{C}$  with hydroxylamino hydrochloride + conc. aq.  $Na_2CO_3$  (73) or with dry  $K_2CO_3$  in ether (74) gives (89.6% yield (74)) *N*-hydroxyurethane (carbethoxyhydroxamic acid) (Beil. III-95, III<sub>2</sub>-(77)], oil, very sol. aq.]

$\bar{C}$  with hydrazine hydrate in alc. refluxed  $\frac{1}{2}$  hr. (75) (for starting with hydrazine sulfate see (76)) gives (yields: 100% (76), 90% (75)) diethyl *sym*-hydrazinedicarboxylate (*sym*-dicarbethoxyhydrazino) (Beil. III-98, III<sub>1</sub>-(46), III<sub>2</sub>-(79)], cryst. from hot aq., ndls. from  $CHCl_3$ , m.p.  $130^{\circ}$  (75),  $131^{\circ}$  (76) (note that the half reaction product, viz., ethyl hydrazinemonocarboxylate (*N*-aminourethane) (ethyl carbazinate), is also known (77) (78) but is an oil. —  $\bar{C}$  (1 mole) with urea (2.1 moles) refluxed for 2-3 hrs. gives (62-65% yield (79)) ethyl allophanate (*N*-carbethoxyurea) (Beil. III-69, III<sub>1</sub>-(31), III<sub>2</sub>-(56)], m.p.  $192^{\circ}$ .

$\bar{C}$  (1 mole) in ether with phenylhydrazine (2 moles) in ether (80) (81) (82) (76) or in aq. pyridine (83) gives (yields: 60-65% (80), 60% (76)) ethyl  $\omega$ -phenylcarbazinate ( $\beta$ -carb-

$\bar{C}$  has strong lachrymatory properties. — [For study of toxicity see (11).] —  $\bar{C}$  is comml. chemical in U.S.A.

[For prepn. of  $\bar{C}$  from carbonyl chloride (phosgene) (3:5000) with abs. EtOH (1:6130) (90% yield (12)) in pres. of dimethylaniline, quinoline, or antipyrine (13) or even  $\text{Ca}(\text{OH})_2$  (14) see indic. refs.; for formn. of  $\bar{C}$  from diethyl carbonate (1:3150) with  $\text{PCl}_5$  (15), from diethyl pyrocarbonate  $\text{O}(\text{COOEt})_2$  (16) with  $\text{SOCl}_2$  (17); from pentachloroethyl chloroformate [Beil. III-13, III-(6)] (18) or *bis*-(trichloromethyl) carboate (triphosgene) (3:1915) (19) or *bis*-(trichloromethyl) oxalate [Beil. III-17] (20) with EtOH, or from K xanthate, ethyl xanthate, or benzyl xanthate with  $\text{Cl}_2$  + aq. in cold (21) see indic. refs.]

Pyrolysis of  $\bar{C}$ .  $\bar{C}$  on htg at  $250^\circ$  decomposes yielding (4)  $\text{EtCl}$  (3:7015) +  $\text{CO}_2$  (for study of this reactn. see (22) (23)); in pres. of certain hydrocarbons or esters (24) or in pres. of dimethylaniline (25) temp. of this decomposition is lowered to  $150^\circ$ , in pres. of quinoline to  $59^\circ$  (26) (27), in pres. of  $\text{AlCl}_3$  to room temp. (28) (see also below under  $\bar{C}$  + pyridine or quinoline).

$\bar{C}$  in pres. of anhydrous  $\text{ZnCl}_2$  (29) (30) or even metallic Zn (31) decomposes at room temp. yielding (29) (30)  $\text{EtCl}$  (3:7015) + ethylene +  $\text{CO}_2$  +  $\text{HCl}$ .

Reactions of the  $-\text{COOC}_2\text{H}_5$  group of  $\bar{C}$ .  $\bar{C}$  on hydrolysis, e.g., by boilg. with aq. or dil. acid (32), yields  $\text{CO}_2$  +  $\text{HCl}$  + ethylene; on alkaline hydrolysis, however, no ethylene is formed (32); note that  $\bar{C}$  does not react with cold aq. very rapidly and may even be washed with it to remove alcohol.

[ $\bar{C}$  at its b.p. treated with  $\text{Cl}_2$  in sunlight undergoes further substitution by halogen yielding as final prod. (33) (31) pentachloroethyl chloroformate (ref. given above under prepn. of  $\bar{C}$ ).]

[ $\bar{C}$  with  $\text{EtHSO}_4$  at  $100^\circ$  under reflux for 6-8 hrs. gives (40% yield (48))  $\text{Et}_2\text{SO}_4$  +  $\text{EtCl}$  (3:7015).]

Reactions of the chlorine atom of  $\bar{C}$ . [ $\bar{C}$  on reduction with 3%  $\text{Na/Hg}$  + aq. gives (51% yield (35)) salt of formic acid (1:1005).]

[ $\bar{C}$  in  $\text{CHCl}_3$  with  $\text{Na}_2\text{O}_2$  does not react until 1-2 drops of aq. are added; vigorous actn. then ensues with formn. of the expected (but very explosive) dicarbethoxy peroxide ( $\text{EtOOC}-\text{O}-\text{O}-\text{COOEt}$ ) (36).]

[ $\bar{C}$  with  $\text{NaSH}$  (37) or with  $\text{C}_2\text{H}_5-\text{S}-\text{MgBr}$  (38 in ether gives (68% yield (38)) *O,S*-diethyl thiocarbonate [Beil. III-133, III-(62), III-(103)], b.p.  $158-159^\circ$  cor.;  $\bar{C}$  (2 moles) + aq. (39) or alc. (40)  $\text{Na}_2\text{S}$ ,  $\bar{C}$  with  $\text{BrMgSH}$  in ether (41), or  $\bar{C}$  with aq. potassium tri-thiocarbonate (39), gives diethyl thiodiformate (dicarbethoxy sulfide) [Beil. III-133, III-(103)], b.p.  $180^\circ$  dec.]

[ $\bar{C}$  with thallous fluoride 12 hrs. at room temp., then refluxed 2-3 hrs., gives (47% yield (42)) ethyl fluoroformate, lachrymatory oil, b.p.  $57^\circ$  (42).]

[For rate of reactn. of  $\bar{C}$  with  $\text{KI}$  in acetone at  $25^\circ$  see (43).]

[ $\bar{C}$  with aq. alc.  $\text{KCN}$  at  $-13^\circ$  (44) or with solid  $\text{NaCN}$  (contg. 0.2-7.0% moisture) at not above  $90^\circ$  (45) gives (yields: 90% (45), 46% (44)) ethyl cyanoformate [Beil. II-547, II-(238), II-(510)], b.p.  $115-116^\circ$  (46),  $D_4^{20} = 1.0034$  (47),  $n_D^{20} = 1.3821$  (47).]

$\bar{C}$  as carbethoxylating agent.  $\bar{C}$  is widely employed as a means of introducing the  $-\text{COOEt}$  group into other organic molecules by reactn. of the chlorine atom with the H of the alcoholic, phenolic, or enolic OH groups (or their metallic alcoholates, phenolates, enolates, etc.); under appropriate conditions  $\bar{C}$  is also employed to introduce the  $-\text{COOEt}$  group into an aromatic nucleus. Examples of these reactns. are cited below.

[ $\bar{C}$  with  $\text{NaOMe}$  yields (49) ethyl methyl carbonate [Beil. III-4, III-(4)], b.p.  $109^\circ$   $\bar{C}$  with  $\text{NaOEt}$  yields diethyl carbonate (1:3150); other alcohols behave similarly (50). —  $\bar{C}$  with K phenolate or  $\bar{C}$  with phenol in ether + dry  $\text{K}_2\text{CO}_3$  gives (71% yield (51)) ethyl phenyl carbonate [Beil. VI-157], b.p.  $229^\circ$ ; other mono-, di-, and polyhydric phenols behave

ethoxy-phenylhydrazine) [Beil. XV-286, XV-(71)], cryst. from dil. alc. nr  $C_6H_6$ /lgr. as monohydrate, m.p.  $85^\circ$  (81) (82), anhydrous form, m.p.  $82-83^\circ$  (81),  $80-82^\circ$  (76). —  $\bar{C}$  with *p*-nitrophenylhydrazine in pyridine gives (84)  $\beta$ -carbethoxy-*p*-nitrophenylhydrazine, cryst. from alc., m.p.  $198-199^\circ$  (84). —  $\bar{C}$  with 2,4-dinitrophenylhydrazine in pyridine gives (84)  $\beta$ -carbethoxy-2,4-dinitrophenylhydrazine, cryst. from aq. alc., m.p.  $168-169^\circ$  (84).

$\bar{C}$  (1 mole) with pyridine (1 mole) in the cold gives first a colorless addn. prod. (85) which rapidly turns red (can be used as test for pyridine (85)) and on warming rapidly decomposes with evolution of  $CO_2$  +  $EtCl$  (3:7015);  $\bar{C}$  similarly treated with quinoline gives a yellow amorphous solid, considerably more stable than the above pyridine epd., but at  $100^\circ$  decomposing similarly but more slowly (85) in the same manner (see also above under pyrolysis).

① Ethyl *N*-phenylcarbamate (phenylurethane): ndls. from hot aq., tbls. from 90% alc., m.p.  $51.5-52^\circ$  (86),  $51-52^\circ$  (21) [From  $\bar{C}$  (1 mole) with aniline (2 moles) (86) (21) or from  $\bar{C}$  with aniline + cold aq.  $Na_2CO_3$  (87).] [For study of rate of this reactn. see (91).]

② Ethyl *N*-(*p*-tolyl)carbamate (*p*-tolylurethane): pr. from alc., m.p.  $52-53^\circ$  (21),  $52^\circ$  (88). [From  $\bar{C}$  (1 mole) with *p*-toluidine (2 moles) in ether (21) (88).]

③ *N,N'*-bis-(Benzyl)urea: ndls. from alc., m.p.  $167.5-169^\circ$  cor. (89). [From  $\bar{C}$  (1 ml.) with benzylamine (3 ml.) + trace  $NH_4Cl$  refluxed 1 hr. (89); note that in this reactn. (unlike the two preceding cases) the reagent amino not only reacts with the chlorine atom of  $\bar{C}$  but also ammonolyzes the carbethoxy group; the prod. is therefore a disubstituted urea rather than the ethyl *N*-benzylcarbamate [Beil. XII-1049], lfts. from lgr., m.p.  $48-49^\circ$  (90), which is formed from  $\bar{C}$  + benzylamine + cold aq.  $NaOH$  (90).]

— *N*-(Carbethoxy)phthalimide: unreported.

— *N*-(Carbethoxy)-3-nitrophthalimide: unreported.

— *N*-(Carbethoxy)-tetrachlorophthalimide: unreported. [Note that  $\bar{C}$  with  $K$  tetrachlorophthalimide fails to react under reflux and explodes on htg. in a.t. (92).]

— *S*-(Carbethoxy)isothioureia picrate: m.p.  $150-151^\circ$  (93). [Note that  $\bar{C}$  (1 mole) with thiourea (1 mole) in conc. aq. soln. on treatment with  $NaHCO_3$  in slight excess evolves  $CO_2$  and ppts. *S*-(carbethoxy)isothioureia bicarbonate, bulky white ppt., insol. aq., m.p.  $59-60^\circ$  dec.; this ppt. on immediate treatment with dil.  $HCl$  dissolves and from the solution  $PkOH$  gives *S*-(carbethoxy)isothioureia picrate; the same prod. may also be obt'd. from the original aq. soln. of  $\bar{C}$  + thiourea by direct addn. of  $PkOH$  (93). — Note, however, that the above bicarbonate on stdg. with aq. changes spontaneously to *N,N*-dicarbethoxythioureia, m.p.  $97^\circ$  dec., + thiourea. — Note, however, that  $\bar{C}$  (1 g.) with thiourea (1 g.) in  $EtOH$  (10 ml.) refluxed 30 min., then treated with  $PkOH$  (1 g.) does not yield the above prods. but instead (94) *S*-ethyl-isothioureia picrate, m.p.  $187^\circ$  (94).]

Note that all samples of  $\bar{C}$  reported prior to 1935 were undoubtedly mixts. of 2-chloropentane ( $\bar{C}$ ) with 3-chloropentane (3:7330). Each of these cpds. is with great ease partially converted to the other (see text), and their mixt. cannot be separated by fractional distillation (1).

[For prepn. of  $\bar{C}$  (or its mixt. with 3-chloropentane (3:7330)) from pentanol-2 (1:6185) with conc. HCl on long stdg. at room temp. (78% yield (1)) or in s.t. at 110° (3) see (1) (2) (3); with conc. HCl +  $\text{ZnCl}_2$  (yield: 70% (6), 49% (16)) see indic. refs.; with  $\text{PCl}_3$  +  $\text{ZnCl}_2$  (64% yield (6)) or  $\text{PCl}_5$  +  $\text{ZnCl}_2$  (56% yield (6)) see (6); with  $\text{SOCl}_2$  + pyridine (gives least rearr. (1)) (yield: 28% (1), 67% (6)) see (1) (6); from pentene-2 on shaking 10 hrs. at room temp. with conc. HCl see (5) (4).] [Note that both pentanol-2 (1:6185) and pentanol-3 (1:6175) with HCl even at room temp. give mixts. of 2-chloropentane ( $\bar{C}$ ) and 3-chloropentane (3:7330) (11).] [For formn. of  $\bar{C}$  in small amt. during reactn. of pentanol-1 (1:6205) with HCl +  $\text{ZnCl}_2$  see (15).]

**3: 7300 d,l-3-CHLORO-2-METHYLBUTENE-1**  
 ( $\alpha,\beta$ -Dimethylallyl chloride)
 $C_5H_9Cl$ 

Beil. I - 211

I<sub>1</sub> - ( 87)I<sub>2</sub> -
 B.P. 93.8° at 760 mm. {1}  
 18.0-18.1° at 30 mm. {1}
 $D_4^{20} = 0.9088$  {1} $n_D^{20} = 1.4304$  {1}

Note:  $\bar{C}$  by virtue of facile allylic transposition is in equilibrium with its synionic isomer, 1-chloro-2-methylbutene-2 (3:7485); reactns. of  $\bar{C}$  may therefore yield also derivatives related to its isomer.

[For prepn. of  $\bar{C}$  (or its mixt. with 1-chloro-2-methylbutene-2) by actn. of  $Cl_2$  as specified {1} on "tertiary amylene" (a mixt. consisting mainly of 2-methylbutene-2 (1:8220) with some 2-methylbutene-1 (1:8210)) see {1}. — The relative amt. of  $\bar{C}$  and its isomer is not constant but usually is about 60% of  $\bar{C}$  with 40% of 1-chloro-2-methylbutene-2, the ratio, however, being independent of the proportion of the two olefins in the starting material.]

[For formn. of  $\bar{C}$  from 2-methylbutene-2 (1:8220) with  $Cl_2$  see {2}; from 2-methylbutene-1 (1:8210) see {3}; from 2,3-dichloro-2-methylbutane (3:7975) + alc. KOH {3} or by thermal dehydrohalogenation at 420-450° {4} see indic. refs.]

$\bar{C}$  on hydrolysis gives not only the corresponding alc. but also that corresponding to the isomeric 1-chloro-2-methylbutene-2 (3:7485) together with a little isopropyl methyl ketone. For details see the isomer (3:7485).

$\bar{C}$  with HCl yields {2} 2,3-dichloro-2-methylbutane (3:7975) + 1,3-dichloro-2-methylbutane (3:9228).

$\bar{C}$  adds  $Br_2$  giving {3} 1,2-dibromo-3-chloro-2-methylbutane, m.p. 197-198° {3}.

(Trimethylvinyl chloride)

[For prepn. of  $\bar{C}$  from isopropyl methyl ketone (1:5410) with PCl<sub>5</sub> see (3) (4); from 3-chloro-2-methylbutanol-2 (3:8030) by dehydration with P<sub>2</sub>O<sub>5</sub> (50% yield (1)), anhyd. oxalic acid (6) at 130°, or strong oxygenated mineral acids such as H<sub>2</sub>SO<sub>4</sub> (92% yield (7)) see indic. refs.]

[For formn. of  $\bar{C}$  (together with other prods.) from 2,3,3-trichloro-2-methylbutane (3:4755) (8) or from 2,3-dichloro-2-methylbutane (3:7975) with alc. KOH (2), from 2-methylbutene-2 (1:8210) with Cl<sub>2</sub> + NaHCO<sub>3</sub> at 0° (70-80% yield (9)) or with *tert*-butyl hypochlorite (3:7165) (47.5% yield (5)), or from 2-methylbutanol-2 (1:6160) with Cl<sub>2</sub> (10) see indic. refs.]

$\bar{C}$  with Cl<sub>2</sub> + NaHCO<sub>3</sub> at 0° gives (9) 80% 3,3-dichloro-2-methylbutene-1 (3:7690) + 10% addn. prod. 2,3,3-trichloro-2-methylbutane (3:4755).

$\bar{C}$  in cold ether adds Br<sub>2</sub> giving (1) (2) 2,3-dibromo-3-chloro-2-methylbutane, cryst. m.p. 197° (1), 197-198° (2).

3:7335 (1) Krassuski, *J. Russ. Phys.-Chem. Soc.* 33, 15-17 (1901); *Cent.* 1901, I 935. (2) Gutner, Tishchenko, *J. Gen. Chem. (U.S.S.R.)* 8, 1062-1067 (1938); *Cent.* 1939, II 4221; *C.A.* 33, 3755 (1939). (3) Gredy, *Bull. soc. chim.* (5) 2, 1951 (1935). (4) Béhal, *Ann. chim.* (6) 15, 284-285

$\bar{C}$  is stable (no change in  $n_D^{20}$ ) on htg. in a.t. at 100° for 48° (1). — However,  $\bar{C}$  on shaking at 26–28° for 24 hrs. with HCl + ZnCl<sub>2</sub> gives a mixt. consisting of 80%  $\bar{C}$  + 20% 3-chloropentane (3:7330) (1).

[For study of rate of hydrolysis by water at 80° and 180° see (7); for rate of reactn. with KI in acetone at 60° see (8); for reactn. with Na see (9).]

⑩ Methyl-*n*-propyl-acetanilide:  $\bar{C}$  with Mg in dry ether yields RMgCl which upon reactn. with phenyl isocyanate and subsequent hydrolysis yields (1) (2) (4) (10) methyl-*n*-propyl-acetanilide, m p. 94-96° (1), 95.2° (11), 92.6° (12), 92.5° (2), 88° cor. (13). [For m.p./compn. data and diagrams for mixts. of methyl-*n*-propyl-acetanilide (from  $\bar{C}$ ) with diethylacetanilide (from 3-chloropentane) see (4) (2) (12).] [For crystallographic study of these two anilides see (15).]

① Methyl-*n*-propyl-acet-*p*-toluidide: m.p. 90-92° u c. (10); 80.5° (11).

⑪ Methyl-*n*-propyl-acet- $\alpha$ -naphthalide: m.p. 102.5–103.5° (10).

0.8723 (14)

97.1-97.4<sup>a</sup> at 760 mm. (3)

96.8-97.2° at 755 mm. (4)

96.7-97.1° at 758 mm. (5)

96° at 753 mm. (14)

96-97° at 729 mm. (6)

$$n_D^{20} = 1.4104 \quad (1)$$

1.4103 (4)

1.40820 (14)

Note that all samples of  $\tilde{C}$  reported prior to 1935 were undoubtedly mixts. of 3-chloropentane ( $\tilde{C}$ ) with 2-chloropentane (3:7325). Each of these cpds. is with great ease partially converted to the other (see text), and the mixture cannot be separated by fractional distillation (1).

[For prepn. of **6** (or its mixture with 2-chloropentane (3:7325)) from pentanol-3 (1:6175) with conc. HCl on long stdg. at room temp. (yield: 84% (1); 69% (3)) see (1) (3); with dil. HCl see (5); with conc. HCl +  $\pi$ -C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> (9:10) or  $\pi$ -C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> (9:10) see (1) (3); with PCl<sub>3</sub> + ZnCl<sub>2</sub> (60% yield) with pyridine gives least rearr. (1)]

(1:8215) + HCl in presence of  $\text{FeCl}_3$  or  $\text{AcOH}$  see (4).] [Note that both pentanol-2 (1:6185) and pentanol-3 (1:6175) with HCl even at room temp. give mixts. of 2-chloropentane (3:7325) and 3-chloropentane ( $\bar{\text{C}}$ ) (1).] [For formn. of  $\bar{\text{C}}$  in small amt. during reactn. of pentanol-1 (1:6205) with HCl +  $\text{ZnCl}_2$  see (12).]

For anal. of mixts. of  $\bar{C}$  with 1-chloro-3-methylbutane (3:7365) via rate of reactn. with KI in acetone see (2).

$\bar{C}$  with Mg in dry ether does not react (8). [However, from corresp. *d,l*-sec.-butyl-carbinyl bromide the R.Mg.Br epd. was obtd. (9) in 66% yield and with phenyl isocyanate yielded *N*-(sec.-butylacet)anilide, m.p. 88° cor. (9), 87° (10).]

3:7345 (1) Hass, McBee, Weber, *Ind. Eng. Chem.* 27, 1192-1195 (1935). (2) Hass, Weber, *Ind. Eng. Chem., Anal. Ed.* 7, 231-233 (1935). (3) Kohlrausch, Köppl, *Monatsh.* 65, 195 (1935). Comml.  $\bar{C}$  may contain unsatd. and P epds. (14).

[For prepn. of  $\bar{C}$  from *n*-butyric acid (1:1035) with  $PCl_5$  (83% yield (15)), with  $PCl_5$  (yield 69–77% (16)) (9) (17) or  $PCl_5$  +  $ZnCl_2$  (77% yield (15)), with  $SOCl_2$  (yield: 97.4% (18), 90% (19), 85% (10), 80% (6) (7), 50% (15) (20), with benzoyl chloride (80–87%

yield (8) (21), with phthalyl dichloride (3:6900) (91.5% yield (22)), with benzotrichloride (3:6540) +  $\text{ZnCl}_2$  at  $70-80^\circ$  (23), or with  $\text{SnCl}_4$  in xylene (49% yield (24)) see indic. refs.; for prepn. of  $\bar{C}$  from  $\alpha$ -chloroethyl *n*-butyrate on warming with a trace of  $\text{ZnCl}_2$  see (25); for prepn. of  $\bar{C}$  from *n*-butyric acid (1:1035) by use of methyl chlorosulfonate, benzene-sulfonyl chloride, etc., see (26).]

[ $\bar{C}$  on hfg. with *n*-butyric acid (9) or with sodium *n*-butyrate yields *n*-butyric anhydride (1:1126), b.p.  $198.2^\circ$  at 760 mm. (12), f.p.  $-75.0^\circ$  (12),  $D_4^{21} = 0.9687$  (27),  $n_D^{19.73} = 1.4124$  (27),  $n_D^{18} = 1.4143$  (28).]

$\bar{C}$  with  $\text{Cl}_2$  in  $\text{CCl}_4$  gives (17) a mixt. of  $\alpha$ -,  $\beta$ - and  $\gamma$ -chloro-*n*-butyryl chlorides, some  $\alpha$ -chloro-*n*-butyric acid anhydride also being formed (29);  $\bar{C}$  with  $\text{SO}_2\text{Cl}_2$  in pres. of dibenzoyl peroxide gives (30) 15%  $\alpha$ -chloro-*n*-butyryl chloride (3.5570), 55%  $\beta$ -chloro-*n*-butyryl chloride (3.9100), and 30%  $\gamma$ -chloro-*n*-butyryl chloride (3.5970). — For study of mech. of chlorination see (31). — [For action of  $\text{PCl}_5$  on  $\bar{C}$  see (32).]

[ $\bar{C}$  with  $\text{Br}_2$  in light yields (17) (33) (14) (34)  $\alpha$ -bromo-*n*-butyryl chloride, b.p.  $151-153^\circ$  (34), and  $\beta$ -bromo-*n*-butyryl chloride.]

[ $\bar{C}$  on cat. h $\gamma$  degenation with  $\text{H}_2$  +  $\text{Pd-BaSO}_4$  cat. in ether (35) or in vapor phase (36) gives *n*-butyraldehyde (1:0130), b.p.  $74.7^\circ$ ;  $\bar{C}$  on reduction with  $\text{Na/Hg}$  or  $\text{Na}$  in moist ether yields (37) (38) (39) octeno-4-diol-4,5 di-*n*-butyrate.]

[ $\bar{C}$  added to large excess of certain  $\text{RMgX}$  cpds. in ether is in part reduced and in part undergoes normal formn. of corresp. ketone: e.g.,  $\bar{C}$  with *tert*- $\text{BuMgCl}$  gives 0% reduction and 71% ketone formn. (6) (7) (11), products include *n*-butyl *n*-butyrate, *tert*-butyl *n*-propyl ketone (2,2-dimethylhexanone-3), and *tert*-butyl-*n*-propyl-carbinyl *n*-butyrate. —  $\bar{C}$  with excess  $\text{C}_6\text{H}_5\text{MgBr}$  gives (84% yield (40)) 1,1-diphenylbutene-1 [Beil. V-648,  $V_1$  (313)].]

[ $\bar{C}$  with chlorosulfonic acid at room temp. (41) or with  $\text{AlCl}_3$  in  $\text{CHCl}_3$  followed by aq. (42) gives di-*n*-propyl ketone (butyrene) (1.5447), b.p.  $144^\circ$ . — Note, however, that  $\bar{C}$  on hfg. with  $\text{AlCl}_3$  at  $60^\circ$  without  $\text{CHCl}_3$ , then poured into aq., yields (42) (43) 2,4,6-triethylphloroglucinol [Beil. VI-1129], m.p.  $107^\circ$ .]

[ $\bar{C}$  with ethylene +  $\text{AlCl}_3$  at  $20^\circ$  gives (70% yield (44)) (45)  $\beta$ -chloromethyl *n*-propyl ketone (1-chlorohexanone-3) [Beil. I-690];  $\bar{C}$  with cyclohexene +  $\text{SnCl}_4$  yields (46) 1-cyclohexenyl *n*-propyl ketone, b.p.  $100-102^\circ$  at 8 mm.,  $D_4^{14} = 0.930$ ,  $n_D^{15} = 1.4885$  (oxime, m.p.  $67^\circ$ , semicarbazone, m.p.  $175^\circ$ ) (46);  $\bar{C}$  with cyclohexene +  $\text{AlCl}_3$  yields (47)  $\alpha$ -methylcyclopentyl *n*-propyl ketone.]

[ $\bar{C}$  with  $\text{C}_6\text{H}_6$  +  $\text{AlCl}_3$  gives (89% yield (48)) (16) phenyl *n*-propyl ketone (butyrophenone) (1.5535), b.p.  $230^\circ$ ;  $\bar{C}$  with toluene +  $\text{AlCl}_3$  gives (49) *n*-propyl *p*-tolyl ketone [Beil. VII-330, VII $_1$ -(175)], b.p.  $230^\circ$ .]

[ $\bar{C}$  with  $\text{AlCl}_3$  + phenol yields (50) (51) (20) 45%  $\alpha$ -(*n*-butyryl)phenol, b.p.  $124-126^\circ$  at 14 mm. (51),  $119^\circ$  at 9 mm. (50), m.p.  $10.5-10.6^\circ$  (50),  $8^\circ$  (51),  $D_4^{21} = 1.0683$  (50),  $n_D^{21.5} = 1.5375$  (50) (semicarbazone, m.p.  $192-193^\circ$  (50), phenylhydrazone, m.p.  $85-87^\circ$  (51)), and 30% *p*-(*n*-butyryl)phenol, b.p.  $200^\circ$  at 15 mm. (51),  $187-189^\circ$  at 9 mm. (50), m.p.  $91-91.5^\circ$  (50) (benzoate, m.p.  $107-107.5^\circ$  (50),  $106-107^\circ$  (51)); for reactn. of  $\bar{C}$  with carvacrol (1:1760) +  $\text{AlCl}_3$  in nitrobenzene see (52), similarly with thymol (1:1430) see (53).]

$\bar{C}$  on hydrolysis yields *n*-butyric acid (1:1035), b.p.  $164^\circ$ ; for the amide, anilide, *p*-toluidide, and other derivs. corresp. to  $\bar{C}$  see *n*-butyric acid (1:1035).

3:7430 1,2-DICHLORO-2-METHYLPROPANE  $\text{CH}_3 \cdot \text{C}_4\text{H}_8\text{Cl}_2$  Beil. I - 120  
 (Isobutylene dieldride)  $\text{CH}_3-\text{C}-\text{CH}_2$  I<sub>1</sub>-(41)  
 $\text{Cl} \quad \text{Cl}$  I<sub>2</sub>-(88)

B.P. 100.5° cor. at 760 mm. (1)  
 107-108° (3) (4) (5) (6) (7)  
 59-60° at 150 mm. (1)  
 38.0-30.2° at 70 mm. (1)

$D_4^{20} = 1.089$  (4)  $n_D^{20} = 1.4370$  (1)  
 $D_{20}^{20} = 1.093$  (1).  $n_D^{17} = 1.4373$  (3)

Liq. with mild clean sweetish odor; stable on stdg. and develops no HCl even in 6 months (1).

[For prepn. from *ter*-butyl chloride (3:7015) by chlorination see (1) (2) (8); from 2-methylpropene (isobutylene) by addn. of  $\text{Cl}_2$  at 0° see (4); from 1-chloro-2-methylpropanol-2 (3:7752) with conc. HCl see (2) (9); from isobutane by chlorination see (10).]

Upon hydrolysis the tertiary chlorine atom shows great reactivity, the primary chlorine atom little. Thus  $\bar{\text{C}}$  on boiling with aq. for 18 hrs. gives (48% yield (2)) 1-chloro-2-methylpropanol-2 (3:7752). [The addn. of bases ( $\text{NaOH}$  or  $\text{NaHCO}_3$ ) or antiaids ( $\text{CaCO}_3$ ) results in lower yields (2).] [In addn. to the above 1-chloro-2-methylpropanol-2 the presence of  $\text{NaHCO}_3$  or  $\text{Na}_2\text{CO}_3$  leads (11) to formn. of 2-methylpropanediol-1,2 (isobutylene glycol) [Beil. I-480], 1-chloro-2-methylpropene-1 ("isocrotyl chloride") (3:7120), and isobutyraldehyde (1:0120).] [For study of methods of conversion of  $\bar{\text{C}}$  to isobutyraldehyde see (1).]

### 3:7455 5-CHLOROPENTENE-2

 $\text{C}_5\text{H}_9\text{Cl}$ 

Beil. S.N. 11

(1-Chloropentene-3)

 $\text{CH}_3\text{CH}=\text{CH}.\text{CH}_2\text{CH}_2\text{Cl}$ 

B.P.

 $107.0$ – $107.6^\circ$  at 755 mm. (1)

 $D_4^{20} = 0.9943$  (1)  $n_D^{20} = 1.4310$  (1)

Two geom. stereoisomers of  $\bar{C}$  are possible but as yet unrecognized.

[For prepn. of  $\bar{C}$  in 75% yield from penten-3-ol-1 with  $\text{SOCl}_2$  in  $\text{CH}_2\text{Cl}_2$  see (1).]

$\bar{C}$  with  $\text{NaI}$  in acetone gives (1) after 11 hrs. reflux 74% yield 1-iodopentene-3, b.p.  $53.6^\circ$  at 20 mm.,  $D_4^{20} = 1.5579$ ,  $n_D^{20} = 1.5153$  (1).

$\bar{C}$  with  $\text{Mg}$  in dry ether yields  $\text{RMgCl}$  (used in reactn. with acrolein (1:0115) to give (50% yield (1)) penten-3-yl-vinyl-carbinol).

3:7455 (1) Goethals, *Bull. soc. chim. Belg.* 46, 417–419 (1937).

### 3:7460 1-CHLOROPENTANE

 $\text{C}_5\text{H}_{11}\text{Cl}$ 

Beil. I - 130

 (*n*-Amyl chloride,

 $\text{CH}_3.\text{CH}_2.\text{CH}_2.\text{CH}_2.\text{CH}_2.\text{Cl}$ 
*n*-butylcarbonyl chloride)

 $I_1$ -( 42)

 $I_2$ -( 95)

B.P.

F.P.

 $108.35^\circ$  cor. at 760 mm. (1) (2)  $-99^\circ$  (2)  $D_4^{25} = 0.87667$  (2)

 $107.74$ – $107.78^\circ$  at 760 mm. (3)  $n_D^{25} = 1.41026$  (2)

 $107$ – $108^\circ$  (4)  $D_4^{20} = 0.8828$  (8)

 $105.7$ – $105.8^\circ$  at 769.3 mm. (5)  $0.8821$  (30)

 $105^\circ$  at 764 mm. (30)  $0.8816$  (2)

 $107.8$ – $108.4^\circ$  at 749.7 mm. (6)  $n_D^{20} = 1.41280$  (8)

 $106.6^\circ$  at 739.8 mm. (7)  $1.41253$  (2)

 $106^\circ$  at 725 mm. (8)  $1.41177$  (30)

 $D_4^{15} = 0.88657$  (2)

 $n_D^{15} = 1.41481$  (2)

Note that most samples of  $\bar{C}$  reported prior to 1938 undoubtedly contained a small amount of mixed 2-chloropentane (3:7325) and 3-chloropentane (3:7330). This previously unrecognized fact may be the cause of much variation in reported physical constants, especially the refractive index.

[For prepn. of  $\bar{C}$  (or its mixt. with 2-chloro- and 3-chloropentane) from pentanol-1 (1:6205) with conc. HCl (7) (4) in s.t. nt 120° for 12–15 hrs. (94% yield (2)) see indic. refs.; with HCl + ZnCl<sub>2</sub> (yield: 67% (30), 57% (8), 72% (9)) see (8) (9) (30); with PCl<sub>3</sub> + ZnCl<sub>2</sub> (70% yield (9)) or PCl<sub>3</sub> + ZnCl<sub>2</sub> (76% yield (9)) see (9); with SOCl<sub>2</sub> + pyridine (gives no rearrangement (8)) (yield: 80% (8), 87% (9)) see (8) (9); for prepn. (23% yield (10)) from  $\gamma$ -chloropropyl *p*-toluenesulfonate by reactn. with EtMgBr see (10).]

[For formn. of  $\bar{C}$  (together with other products) during chlorination of pentane see (11) (12) (13) (14).]

$\bar{C}$  with EtOH forms const.-boilg. mixt., b.p. 72.5°, but forms no azeotrope with MeOH.  $\bar{C}$  forms with aq. a const.-boilg. mixt., b.p. 82°.

$\bar{C}$  on htg. with conc. HCl + ZnCl<sub>2</sub> at 126–134° for 12 hrs. undergoes partial isomerization forming 3% of a mixt. of 2-chloropentane (3:7325) and 3-chloropentane (3:7330) (8).

[For study of rate of hydrolysis by aq. at 80° and 180°, and rate of cleavage of HCl at 180°, see (11); for rate of reactn. with KI in acetone see (4) (15) (16); for reactn. with Na—C $\equiv$ CH see (17) (18); with KCN see (19); with Cl<sub>2</sub> see (6); for extensive study of reactn. with Na see (19) (20) (21) (22) (23) (24) (25).]

④ *n*-Caproanilide:  $\bar{C}$  with Mg in dry ether yields RMgCl which upon reactn. with phenyl isocyanate and subsequent hydrolysis yields (26) *n*-caproanilide, m.p. 96° cor. (27), 94–95° u.c. (20), 92° (23).

⑤ *n*-Capro-*p*-toluidide: m.p. 74–75° u.c. (26), 73° (28). [From RMgCl + *p*-tolyl isocyanate as above (26).]

⑥ *S*-*n*-Amylthiourea picrate: m.p. 154° (29). [From  $\bar{C}$  in alc. on refluxing 2 hrs. with thiourea, followed by addn. of PkOH (29).]

— *N*-(*n*-Amyl)tetrachlorophthalimide: ndls. from CHCl<sub>3</sub>, poured into 2 vols. MeOH, m.p. 145–146° (31).

		168-169°	at 723 mm. (7)

Colorless tils. or ndls. volatile even at ord. temp. — Vapors are lachrymatory; liquid blisters skin. — Appreciably sol. in aq. especially on warming, eas. sol. alc., ether. — Volatile with steam.

[For prepn. of  $\bar{C}$  from 1,3-dichloropropanol-2 (glycerol  $\alpha$ -dichlorohydrin) (3:5985) by oxidn. with  $\text{Na}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$  (68-75% yield (10)), with  $\text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$  (1) (2) (4) (6) (7) (8) (9) (11) (generally poorer yields) see indic. refs (note also that h.p. of  $\bar{C}$  is very close to that of the precursor 1,3-dichloropropanol-2 (3:5985), a fact which leads to some doubt as to the true yield of  $\bar{C}$  in certain of the older reports); for prepn. of  $\bar{C}$  from acetone (1:5400) with  $\text{Cl}_2$  directly (12), in pres. of  $\text{I}_2$ ,  $\text{FeCl}_3$ , or  $\text{SbCl}_5$  (yield: 28%  $\bar{C}$  accompanied by 48.6% *unsym.*-dichloroacetone (3:5430) (13)), in pres. of  $\text{NiCl}_2$  at 70° (other prods. are also formed (14)), or in pres. of aq. +  $\text{CaCO}_3$  (yield: 10%  $\bar{C}$  accompanied by other prods. (16)) (4) (15), see indic. refs.]

[For prepn. of  $\bar{C}$  from epichlorohydrin (3-chloro-1,2-epoxypropane) (3:5353) with  $\text{S}_2\text{Cl}_2$  (yield: 33%  $\bar{C}$  accompanied by 67% 1,3-dichloropropanol-2 (3:5985) (17)), from ethyl  $\gamma$ -( $\alpha$ )-chloro- $\alpha$ -( $\gamma$ )-ethoxyacetate (18) or from ethyl  $\alpha,\gamma$ -dichloroacetate (19) by ketonic cleavage with  $\text{HCl}$ , from allene (propadiene) (20) or 1,2-dichloropropene-2 (21) with  $\text{HOCl}$ , or from 1,3-dihydroacetone on digestion with  $\text{AgCl}$  (22) cf. (3) see indic. refs.]

[ $\bar{C}$  on reduction with yeast gives (53% yield (2)) 1,3-dichloropropanol-2 (3:5985), b.p. 178° (2). —  $\bar{C}$  with  $\text{Zn} + \text{AcOH}$  does not give acetone but yields (23) a gas formerly supposed to have been cyclopropanone (since it yielded with semicarbazide a semicarbazone, m.p. 156° (23)) although in the light of later work (21) (25) (26) this now appears very doubtful. — For polarographic study of reduction potential of  $\bar{C}$  see (27).]

$\bar{C}$  with aq. alk. presumably yields 3-chloropropanone-2-ol-1 [Boil. I-823] and/or propenone-2-ol-1,3 (dihydroxyacetone) [Boil. I-816, I<sub>1</sub>-(428), I<sub>2</sub>-(689)] since  $\bar{C}$  readily reduces Fehling's soln. (28).

$\bar{C}$  with satd. aq.  $\text{NaHSO}_3$  soln. yields a  $\text{NaHSO}_3$  cpd. which seps. with  $2\frac{1}{2} \text{H}_2\text{O}$  (1),  $3 \text{H}_2\text{O}$  (7). —  $\bar{C}$  with aq.  $\text{K}_2\text{SO}_3$  soln. yields (30) corresp. salt of acetone- $\alpha,\alpha'$ -disulfonic acid [Boil. IV<sub>2</sub>-(530)].

[ $\bar{C}$  with  $\text{KOAc}$  (slightly more than 1 mole) in boilg.  $\text{AcOH}$  gives (48% yield (29)) chloroacetyl methyl acetate, b.p. 112-114° at 16 mm. (29) —  $\bar{C}$  with  $\text{K}$  benzoate refluxed in alc. yields (23) 1,3-dibenzoyloxyacetone, long ndls. from alc., but m.p. not reported.]

[ $\bar{C}$  in dry  $\text{MeOH}$  treated with  $\text{HCl}$  gas gives (81.5% yield (31)) 1,3-dichloroacetone dimethylketal, cryt. from  $\text{MeOH}$ , m.p. 81.5° (31);  $\bar{C}$  in abs.  $\text{EtOH}$  similarly treated gives (smaller yield (31)) 1,3-dichloroacetone diethylketal, m.p. 28° (31). — For reactn. of  $\bar{C}$  with ethylene glycol see (32).]

[For prepn. of  $\bar{C}$  from  $\beta,\beta'$ -dichlorodiethyl ether (3:6025) with solid  $N_2OH$  at  $200^\circ$  (1) or with triethanolamine + solid  $NaOH$  (70% yield (2)) see indic. refs.]

$\bar{C}$  is stable toward alkalis but with dil. acids even in cold is readily and quant. hydrolyzed (1) to  $\beta$ -chloroethanol (3:5552) and acetaldehyde (1:0100).

$\bar{C}$  with diethyl sodiomalonate gives (73% yield (1)) diethyl  $\beta$ -(vinylxy)ethyl malonate, b.p.  $130-135^\circ$  at 0 mm.,  $D_{15}^{20} = 1.0575$  (1); this prod. condenses (1) with urea to give 5-( $\beta$ -(vinylxy)ethyl)barbituric acid (whose properties appear to be subsequently unreported) which itself with dil. minl. acid hydrolyzes to give 5-( $\beta$ -hydroxyethyl)barbituric acid, m.p. above  $300^\circ$  (3). — For analogous reactions of  $\bar{C}$  with various diethyl alkylmalonates and reaction of the products with urea to give the corresp. 5-alkyl-5-( $\beta$ -(vinylxy)ethyl)-barbituric acids see (3). —  $\bar{C}$  with diethyl phenyl-sodio-malonate in s.t. at  $140-145^\circ$  for 14 hrs. gives (52% yield (4)) diethyl 5-phenyl-5-( $\beta$ -(vinylxy)ethyl)malonate, b.p.  $196-197^\circ$  at 17 mm.,  $D_4^{20} = 1.098$ ; this prod. with urea gives (4), 5-phenyl-5-( $\beta$ -(vinylxy)ethyl)-barbituric acid which upon hydrolysis with dil. acid gives (10% yield (4)) 5-phenyl-5-( $\beta$ -hydroxyethyl)barbituric acid ("hydroxyluminal").]

$\bar{C}$  with phenylacetonitrile gives (50% yield (4)) phenyl-( $\beta$ -vinylxyethyl)acetonitrile, b.p.  $147^\circ$  at 8 mm.,  $D_4^{20} = 1.029$  (4).]

[For use of  $\bar{C}$  in prepn. of cellulose ethers see (5).]

### 3:7465 4-CHLORO-2-METHYLBUTENE-2

( $\gamma,\gamma$ -Dimethylallyl chloride;  
isoprene hydrochloride)

$C_5H_9Cl$  Beil. I - 214  
I<sub>1</sub> - (88)  
I<sub>2</sub> - (191)

B.P.  $109^\circ$  (1)

$D_4^{20} = 0.9336$  (1)  $n_D^{20} = 1.43975$  (4)

$30-33^\circ$  at 40 mm. (4)

Colorless liq. with odor like allyl chloride. —  $\bar{C}$  darkens on stdg. and loses  $HCl$  on distn. (1).

[For prepn. of  $\bar{C}$  from 2-methylbutadiene-1,3 (isoprene) (1:8020) by 1,4-addn. of dry  $HCl$  gas see (1) (4).]

$\bar{C}$  on htg. in s.t. with  $KOAe$  +  $AcOH$  (1) or passed over  $TiO_2$  at  $425-450^\circ$  at reduced press. (3) loses  $HCl$  yielding isoprene (1:8020), b.p.  $34^\circ$ .

$\bar{C}$  reduces alk.  $KMnO_4$  (1).

$\bar{C}$  in conc.  $HCl$  satd. with  $HCl$  gas gives (94% yield (1)) 2,4-dichloro-2-methylbutane (3:8105), b.p.  $145-146^\circ$  (1) cf. (4).

$\bar{C}$  in  $CHCl_3$  adds 1  $Br_2$ , yields (1) 2,3-dibromo-4-chloro-2-methylbutane, oil decomposing on distn. even under reduced press. (1).

[For behavior of  $\bar{C}$  with  $AlCl_3$  see (2).]

( $\beta,\gamma$ -Dimethylallyl chloride)  $\text{CH}_3-\text{CH}=\text{C}(\text{CH}_3)-\text{CH}_2\text{Cl}$  I<sub>r</sub>—  
I<sub>r</sub>-(189)

B.P. 110° at 760 mm. (1)

$D_4^{20} = 0.9327$  (1)

108-110° (2)

$n_D^{20} = 1.4481$  (1)

25.9-26.4° at 25 mm. (1)

$D_4^{15} = 0.9324$  (2)

Note.  $\bar{\text{C}}$  by virtue of facile allylic transposition is in equilibrium with its synionic isomer 3-chloro-2-methylbutene-1 (3:7300); reactns. of  $\bar{\text{C}}$  therefore may also yield derivatives related to its isomer.

[For prepn. of  $\bar{\text{C}}$  (or its mixt. with the synionic 3-chloro-2-methylbutene-1 (3:7300)) by actn. of  $\text{Cl}_2$  as specified (1) on "tertiary amylene" (a mixt. consisting mainly of 2-methylbutene-2 (1:8220) with some 2-methylbutene-1 (1:8210)) see (1).—The relative amt. of  $\bar{\text{C}}$  and its isomer is not constant but usually is about 40% of  $\bar{\text{C}}$  with 60% of 3-chloro-2-methylbutene-1 (3:7300), the ratio, however, being independent of the proportion of the two olefins in the starting material.]

[For formn. of  $\bar{\text{C}}$  from 2-methylbutene-2 (1:8220) with  $\text{Cl}_2$  see (2); from 2-methylbutene-1 (1:8210) see (3); for prepn. of  $\bar{\text{C}}$  (together with other prods.) from 1-chloro-2-methylbutanol-2 (3:8175) by distn. with anhyd. oxalic acid (4) or with  $\text{Ac}_2\text{O}$  + conc.  $\text{H}_2\text{SO}_4$  (5) see (4) (5); for prepn. of  $\bar{\text{C}}$  from 2-methylbuten-2-ol-1 with  $\text{PCl}_5$  + pyridine see (1).]

$\bar{\text{C}}$  on hydrolysis gives not only the alc. corresponding to  $\bar{\text{C}}$  but also that corresp. to the isomeric 3-chloro-2-methylbutene-1 (3:7300) together with a little ketone: thus  $\bar{\text{C}}$  on hydrolysis with 12 pts. aq. at 70° for 16 hrs. gives (6) 25% alc. A (2-methylbuten-1-ol-3) [*N*-( $\alpha$ -naphthyl)carbamate, m.p. 91.5-93° (6)] + 50% alc. B (2-methylbuten-2-ol-1) [*N*-( $\alpha$ -naphthyl)carbamate, m.p. 103-103.5° (6)] + 5% isopropyl methyl ketone (1:5410);

## 3:7475 3-CHLORO-2,2-DIMETHYLBUTANE

 $C_6H_{13}Cl$ 

Beil. S.N. 10

(Pinacolyl chloride;

ter-butyl-methyl-carbinyl chloride)

B.P. 109.0° at 734 mm. (1)

 $D_4^{20} = 0.8767$  (1)  $n_D^{20} = 1.4181$  (1)

[For formn. of  $\bar{C}$  (11%) from 2,2-dimethylbutane (neohexane) (1:8510) on chlorination see (1).] [Note that the corresp. alc. (pinacolyl alc.) (1:6186) with HCl does not give  $\bar{C}$  but rather rearr. prods. (2).]

$\bar{C}$  with Mg in dry ether gives  $RMgCl$  which with oxygen yields (1) pinacolyl alc. (1:6186) q.v.

① Pinacolyl mercuric chloride ( $C_6H_{13}HgCl$ ): cryst. from dil. alc., m.p. 89-90° (3); 89.5-90° (2). [From  $RMgCl$  +  $HgCl_2$  in ether.]

[For density of  $\bar{C}$  at 0°, 15°, 25°, 50°, and 65°, together with parachors at 0°, 25°, 50°, and 75°, see (9).]

[For prepn. of  $\bar{C}$  from corresp. alc., dimethyl-*n*-propyl-carbinol (2-methylpentanol-2) (1:6190) with  $PCl_5$  (6), with  $HCl$  gas (1) (2), or with conc.  $HCl$  (4) (5) see indic. refs.; for prepn. (68% yield) from ethyl-isopropyl-carbinol (2-methylpentanol-3) (1:6194) with  $HCl$  as the result of rearrangement see (1); for formn. (together with other products) from reaction of 2-ethylbutanol-1 (1:6223) with  $HCl + ZnCl_2$  see (3); for formn. from 2-methylpentene-2 (1:8275) by addn. of  $HCl$  see (7) (8).]

[For study of rate of reaction with  $KI$  in acetone see (5).]

$\bar{C}$  with  $Mg$  in dry ether yields  $RMgCl$ ; upon treatment with oxygen this gives (48% yield (1)) of dimethyl-*n*-propyl-carbinol (2-methylpentanol-2) (1:6190) q.v.

Ⓐ Dimethyl-*n*-propyl-acetanilide: m.p. 70.5–74° (3). [From  $\bar{C}$  via conversion to  $RMgCl$  and reaction with phenyl isocyanate (3).]

Ⓑ Dimethyl-*n*-propyl-acet- $\alpha$ -naphthalide: m.p. 116–118° (3). [From  $\bar{C}$  via conversion to  $RMgCl$  and reaction with  $\alpha$ -naphthyl isocyanate (3).]

3: 7490 (1) Whitmore, Johnston, *J. Am. Chem. Soc.* 60, 2267 (1938). (2) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938). (3) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938). (4) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938). (5) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938). (6) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938). (7) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938). (8) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938). (9) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938).

### 3: 7495 *d,l*-4-CHLORO-2-METHYLPENTANE

(*d,l*-Isobutyl-methyl-carbinyl  
chlorido)

Bell. I —

I<sub>1</sub> —

I<sub>2</sub>-(111)

B.P. 111–112° at 773 mm. (1)

$D_4^{20} = 0.801$  (1)  $n_D^{20} = 1.4113$  (1)

[For prepn. of  $\bar{C}$  from 2-methylpentanol-4 (1:6199) with dry  $HCl$  for 18 weeks (82% yield) see (1); for formn. of  $\bar{C}$  (together with other products) in reaction of 2-ethylbutanol-1 (1:6223) with  $HCl + ZnCl_2$  see (2).]

$\bar{C}$  with  $Mg$  in dry ether yields  $RMgCl$  which with  $O_2$  gives (62% yield (1)) 2-methylpentanol-4 (1:6199) [*N*-( $\alpha$ -naphthyl)carbamate, m.p. 03.5–04.5° (2)]; this alc. upon oxidn. with  $CrO_3/H_2SO_4$  yields (2) 4-methylpentanone-2 (1:5430) q.v.

3: 7495 (1) Whitmore, Johnston, *J. Am. Chem. Soc.* 60, 2267 (1938). (2) Whitmore, Karnatz, *J. Am. Chem. Soc.* 60, 2535 (1938).

$\bar{C}$  on hydrolysis with 2 pts. aq. + 1 mole  $\text{CaCO}_3$  for 4 hrs. at  $70^\circ$  gives (6) 60% alc.  $A$  + 30% alc.  $B$  + 5% isopropyl methyl ketone (1:5410);  $\bar{C}$  on hydrolysis with  $\text{CaO}$  for  $1\frac{1}{2}$  hrs. gives (6) 70% alc.  $A$  + 25% alc.  $B$  + a trace of ketone.

[For study of reactn. of  $\bar{C}$  with  $\text{NaI}$  (4) and its rate of reactn. with  $\text{KI}$  in acetone at  $20^\circ$  (7) or with  $\text{NaOEt}$  in alc. at  $35^\circ$  (7) see indic. refs.; the reactivity of the halogenation of  $\bar{C}$  is greater than that in crotyl chloride (1-chlorobutene-2) (3:7205) and the latter in turn is more reactive than that in methallyl chloride (3-chloro-2-methylpropene-1) (3:7145) or allyl chloride (3:7035), which are about the same (4).]

$\bar{C}$  on treatment with  $\text{O}_3$  followed by hydrolysis yields (3) (2) chloroacetone (3:7212) + acetaldehyde (1.0100).

3:7485 (1) Buign, Engs, Groll, Hearne, *Ind Eng. Chem.* **31**, 1416 (1939). (2) Tishchenko, *J. Gen. Chem. (U.S.S.R.)* **6**, 1116-1133 (1936); *Cent.* **1937**, **1** 572. *C.A.* **31**, 1003 (1937). (3)

### 3:7487 ALLYL CHLOROFORMATE

Beil. III - 12

(Allyl chlorocarbonate)  $\text{Cl.CO.O.CH}_2\text{CH=CH}_2$

III<sub>1</sub>—

III<sub>2</sub>-(11)

B.P.  $110-111.5^\circ$  at 765 mm. (1)

$110^\circ$  (2)

Note that the prod. of b.p.  $180^\circ$ , formerly (3) supposed to have been  $\bar{C}$ , is in fact (2) diallyl carbonate.

[For prepn. of  $\bar{C}$  from allyl alc. (1:6145) with phosgene (3:5000) (yield 37% (1)) (4) (2) see indic. refs.; note that some diallyl carbonate, b.p.  $166^\circ$  at 730 mm. (2), is also formed (2).]

$\bar{C}$  in quinoline begins to decompose at  $37^\circ$  (5) (6) presumably into  $\text{CO}_2$  + allyl chloride (3:7035) although this is not specifically stated.

[For reaction of  $\bar{C}$  with diethylene glycol (1:6525), triethylene glycol (1:6538), etc., see (7).]

(7) Muskat, Strain (to Pittsburgh Plate Glass Co.), U.S. 2,370,565, Feb. 27, 1945; *C.A.* **39**, 4526 (1945).

### 3:7490 2-CHLORO-2-METHYLPENTANE

(Dimethyl-*n*-propyl-carbonyl chloride)

Beil. I - 148

I<sub>1</sub>-(53)

I<sub>4</sub>-(111)

B.P.

$110-111^\circ$  dec. at 734 mm. (1)

$D_4^{20} = 0.863$  (1)

$110-113^\circ$  (2)

$64.5-64.7^\circ$  at 160 mm. (3)

$D_4^{15} = 0.8678$  (2)

$50-53^\circ$  at 41 mm. (4)

$n_D^{20} = 1.4126$  (3); cf. (1)

$36-37^\circ$  at 15 mm. (5)

$n_D^{16.5} = 1.4176$  (2)

$\bar{C}$  decomposes considerably if distd. at ord. press. (3).

[For prepn. (93% yield (2)) from paraldehyde (1:0170) + *n*-propyl alc. (1:6150) + dry HCl see (2) (3).]

$\bar{C}$  on stdg. polymerizes to dark tarry residue (2).

[ $\bar{C}$  on bromination yields  $\alpha,\beta$ -dibromoethyl *n*-propyl ether (3).]

$\bar{C}$  on shaking with aq. yields acetaldehyde (1:0100), *n*-propyl alc. (1:6150) + HCl.

3:7525 (1) Gauthier, *Ann. chim.* (8) **16**, 312 (1909). (2) Henze, Murchison, *J. Am. Chem. Soc.* **53**, 4077-4079 (1931). (3) Dykstra, Lewis, Boord, *J. Am. Chem. Soc.* **52**, 3399-3400 (1930).

## 3:7530 2-CHLOROHEXENE-1

 $\text{C}_6\text{H}_{11}\text{Cl}$ 

Beil. S.N. 11

B.P.  $113^\circ$  at 740 mm. (1)  $D_4^{25} = 0.8886$  (1)  $n_D^{25} = 1.4278$  (1)  
 $109.5-110.5^\circ$  at 735 mm. (2)  $0.8872$  (2)  $1.4187$  (2)

[For prepn. of  $\bar{C}$  from hexyne-1 (1:8055) with dry HCl +  $\text{BiCl}_3$  in  $\text{C}_6\text{H}_6$  (20% yield (1) together with 40% yield 2,2-dichlorohexane (3:9342)) or with  $\text{AcCl}$  +  $\text{SnCl}_4$  (15% yield (2) together with 37% 4-chloro-octen-3-one-2, b.p.  $75-95^\circ$  at 20 mm.) see (1) (2); for prepn. of  $\bar{C}$  (60.5% yield (1)) from 2,2-dichlorohexane (3:9342) with KOH in *n*-propyl alc. at  $95^\circ$  see (1).]

$\bar{C}$  in  $\text{CCl}_4$  +  $\text{SbCl}_5$  treated with  $\text{Cl}_2$  at  $35-40^\circ$  gives (1) (3) *cis*-1,2-dichlorohexene-1 (3:9330) (26.7% yield (1)) together with 25.4% 1,1,2,2-tetrachlorohexane (3:9332).

3:7530 (1) Hennion, Walsh, *J. Am. Chem. Soc.* **62**, 1367-1368 (1940). (2) Kroeger, Sowa, Nieuwland, *J. Org. Chem.* **1**, 163-169 (1936). (3) Norris, Hennion, *J. Am. Chem. Soc.* **62**, 450 (1940).

## 3:7535 3-CHLOROHEXENE-3

 $\text{C}_6\text{H}_{11}\text{Cl}$ 

Beil. S.N. 11

B.P.  $113.0-113.5^\circ$  at 748 mm. (1)  $D_4^{25} = 0.8898$  (1)  $n_D^{25} = 1.4320$  (1)

Two geom. stereoisomers of  $\bar{C}$  are possible, but only this one is as yet recognized.

[For prepn. of  $\bar{C}$  from hexyne-3 (diethylacetylene) (1:8065) with  $\text{AcCl}$  +  $\text{SnCl}_4$  see (1); (both *cis* and *trans* stereoisomers of 4-chloro-3-ethylhexen-3-one-2 are also formed).]

3:7535 (1) Kroeger, Sowa, Nieuwland, *J. Org. Chem.* **1**, 163-169 (1936).

3:7540 *n*-PROPYL CHLOROFORMATE $\text{C}_4\text{H}_7\text{O}_2\text{Cl}$ 

Beil. III - 11

(n-Propyl chlorocarbonate)

 $n\text{-C}_3\text{H}_7\text{O.CO.Cl}$ 

III-(6)

III-(10)

B.P.  $114-115.5^\circ$  at 768 mm. (1)  $D_4^{20} = 1.0901$  (1)  $n_D^{20} = 1.40350$  (4)  
 $115.2$  cor. (2) (3)

$\bar{C}$  reacts but slowly with cold aq., more rapidly on warming, yielding *n*-propyl alc. (1:6150) +  $\text{CO}_2$  + HCl.

[For prepn. from *n*-propyl alc. (1:6150) + phosgene (3:5000) (42% yield (3)) see (2) (3).]

$\bar{C}$  on htg. with  $\text{ZnCl}_2$  yields (5) propylene,  $\text{CO}_2$  + HCl;  $\bar{C}$  on warming with pyridine or quinoline dec. at  $66^\circ$  into *n*-propyl chloride (3:7040) +  $\text{CO}_2$  (6) cf. (7).

## CHAPTER XVII

### DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

#### Section 2. $D_4^{20}$ less than 1.1500

(3:7500-3:7999)

3:7500 4-CHLORO-4-METHYLPENTENE-1  $C_6H_{11}Cl$  Beil. I - 217  
 (2-Chloro-2-methylpentene-4)  
 (Allyl-dimethyl-carbinyl  
 chloride)

$I_1-$   
 $I_2-$

B.P. 109-114° s.l. dec. (1)

[For prepn. of  $\bar{C}$  from 2-methylpenten-4-ol-2 (allyl-dimethyl-carbinol) [Beil. I-445,  $I_2$  (487)] with  $PCl_5$  see (1).]

3:7500 (1) M. Saytzeff, A. Saytzeff, *Ann.* 185, 156 (1877).

3:7520 1-CHLORO-2,3-DIMETHYLBUTENE-2  $C_6H_{11}Cl$  Beil. S.N. 11  
 ( $\beta,\gamma,\gamma$ -Trimethylallyl chloride)

B.P. 111-112° at 756 mm. (1)

$D_4^{19} = 0.8895$  (1)  $n_D^{19} = 1.4315$  (1)

Note.  $\bar{C}$  by virtue of allylic transposition would be expected to be in equilibrium with its synionic isomer 3-chloro-2,3-dimethylbutene-1 ( $\alpha,\alpha,\beta$ -trimethylallyl chloride). The material described by (1) was regarded as  $\bar{C}$ ; the isomer seems to be unrecorded.

[For prepn. of  $\bar{C}$  (or its mixt. with 3-chloro-2,3-dimethylbutene-1) in 90% yield from 2,3-dimethylbutene-2 (tetramethylethylene) (1:8290) with  $Cl_2 + NaHCO_3$  at 0° see (1).]

$\bar{C}$  on hydrolysis yields (1) a hexenol (regarded (1) as 2,3-dimethylbuten-1-ol-3 derived from the synionic isomer of  $\bar{C}$ ), b.p. 116-118°,  $D_4^{17} = 0.835$ ,  $n_D^{17} = 1.4248$  (1).

113.8-113.9° (2)  
113-115° (3) (7)

[For prepn. (47% yield (4)) from *n*-butyraldehyde (1:0130) by actn. of  $\text{PCl}_5$  (39% yield (9)) see (1) (2) (3) (9); for formn. from butane by chlorination see (5) (6); for formn. from *n*-butyl chloride (3:7160) on chlorination see (7) (8).]

[ $\bar{C}$  with equal wt. ethyl mercaptan gives (34% yield (33)) 1,3-bis-(ethylmercapto)-propanone-2, b.p. 117–121° at 15 mm. (33) (corresp. semicarbazone, m.p. 98–99°), but  $\bar{C}$  with large excess ethyl mercaptan (4 wt. pts.) gives also 1,2,2,3-tetra(ethylmercapto)-propane, oil (33). —  $\bar{C}$  (1 mole) with benzyl mercaptan (2 moles) in alc. NaOH yields (34) 1,3-bis-(benzylmercapto)propanone-2, nil, which on oxidn. in acid soln. with  $KMnO_4$  gives the corresp. disulfone, ndls. from alc., m.p. 182° (34).] — [For reactn. of  $\bar{C}$  with alk. sulfides and/or polysulfides in prepa. of resins see (37).]

$\bar{C}$  with KI even at room temp. (7) yields 1,3-diiodoacetone, pr. from acetone, m.p. 61°. [For reaction of  $\bar{C}$  with  $MeMgBr$  as means of prepa. of *sym.*-dichloro-*ter*-butyl alcohol (3:5977) see the latter.]

[ $\bar{C}$  with excess conc. aq. or liq. HCN in alc. at 30° for 12 hrs. (11) cf. (35) or with 25% HCN in pres. of a little  $NH_4OH$  (36) yields  $\beta,\beta'$ -dichloro- $\alpha$ -hydroxyisobutyronitrile (not isolated), which on hydrolysis with HCl (11) (35) (36) gives the corresp. acid,  $\beta,\beta'$ -dichloro- $\alpha$ -hydroxyisobutyric acid, m.p. 91–92° (11).]

[ $\bar{C}$  with diazotized aniline in pres. of  $NaOAc$  yields (3) 1,3-dichloro-1-(benzenecazo)-propanone-2, red-or. cryst. from hot alc., m.p. 156–157° (3); for corresp. homologs using diazotized *o*-toluidine or *p*-toluidine see (3).]

[ $\bar{C}$  with equiv. molar quant. thioacetamide in acetone or alc. followed by htg. with  $ZnCl_2$  (38) (39) gives 4-(chloromethyl)-2-methylthiazole hydrochloride (free base is oil, b.p. 65–67° at 3 mm. (38) (39)); for polymerization of this prod. by htg. see (38). —  $\bar{C}$  with thiobenzamide in acetone followed by htg. of resultant intermediate with HCl in acetone gives 4-(chloromethyl)-2-phenylthiazole hydrochloride (yields: 80–81% (40) (41)) (corresp. free base, m.p. 51° (40), 48.2–51.2° cor. (41)); for reactns. of this prod. see (41). — For analogous reactn. of  $\bar{C}$  with many other substituted thiobenzamides to give corresp. substituted thiazoles see (40) (39).]

[ $\bar{C}$  with equiv. molar amt. carbamyl chloride in dry ether at room temp. for 15 min. is claimed (2) to yield  $\beta,\beta'$ -dichloroisopropyl carbamate ("Aleudrin"), white cryst. from alc., m.p. 80–81° (2);  $\bar{C}$  with 2 molar equivs. of carbamyl chloride similarly treated is claimed (2) to yield  $\beta,\beta'$ -dichloroisopropyl allophanate, cryst. from 60% alc., m.p. 182° (2); note, however, that in view of the facts that the  $\bar{C}$  used in the cited work was obt'd. from 1,3-dichloropropanol-2, that the b.p.'s of this precursor and  $\bar{C}$  are almost identical, and that the  $\bar{C}$  employed was purified only by distillation, the indicated esters may have been due to the presence of unoxidized starting material.]

① 1,3-Dichloropropanone-2 semicarbazone: m.p. 120° (23). [Note that this prod. is very sensitive to heat (care in recrystn. from aq. or  $C_6H_6$ ) and is also changed by stdg. in solution (23).]

② 1,3-Dichloropropanone-2 4-(*p*-bromophenyl)semicarbazone: ndls. from alc., m.p. 196° cor. dec. (42). [From  $\bar{C}$  + 4-(*p*-bromophenyl)semicarbazide in alc. refluxed for 12 hrs. (42).]

③ Condensation product ( $C_{17}H_{19}O_4N_3SCH_3$ ) of  $\bar{C}$  with *N*-methyl-3-(carbohydrazido)-pyridinium *p*-toluenesulfonate: cryst. from 1:1 alc./ether, m.p. 115° cor. (43). [From  $\bar{C}$  with nicotinic acid hydrazide metho-*p*-toluenesulfonate in abs. alc. on refluxing for 15 mins. (43).]

Colorless liq. at first immiscible with aq. but grad. hydrolyzing (especially on warming) to acetaldehyde (1:0100) and HCl (1) (2).

[For prepn. of  $\bar{\text{C}}$  from acetaldehyde (1:0100) with dry HCl gas see (2) (1).]

For identification hydrolyze  $\bar{\text{C}}$  to acetaldehyde (1:0100) (3), derivatize the latter, e.g., via the *p*-nitro- or 2,4-dinitrophenylhydrazones.

3:7595 (1) Lieben, *Ann.* 100, 337 (1858). (2) Geuther, Laatsch, *Ann.* 218, 16-18 (1883). (3) Gebauer-Fuelnegg, Moffett, *J. Am. Chem. Soc.* 56, 2009 (1934).

3:7597 2-CHLORO-2-METHYLBUTANONE-3  $\text{CH}_3$   $\text{C}_5\text{H}_9\text{OCl}$  Beil. S.N. 87

B.P. 117.2° (1)

 $D_4^{20} = 1.0083$  (1)  $n_D^{20} = 1.42044$  (1)

[For prepn. of  $\bar{\text{C}}$  from 2-methylbutanone-3 (isopropyl methyl ketone) (1:5410) with  $\text{SO}_2\text{Cl}_2$  in cold (84% yield (1)) or with  $\text{Cl}_2$  by vapor-phase chlorination (2) see indic. refs.]

$\bar{\text{C}}$  with 20% aq.  $\text{Na}_2\text{CO}_3$  refluxed for 37 hrs. gives (1) 2-methylbutanone-3-ol-2 [Beil. I-832, I<sub>1</sub>-(422), I<sub>2</sub>-(873)], h.p. 143° (1).

$\bar{\text{C}}$  with 40% aq.  $\text{NaOH}$  refluxed 20 hrs. gives (1) trimethylacetic acid (1:0410), h.p. 163°, m.p. 35° (1) (note structural change during this reaction).

$\bar{\text{C}}$  with aq.  $\text{KCN}$  in cold for 1 hr. gives (1) 2,3-dimethyl-2,3-epoxy-*n*-butyronitrile, h.p. 157.8° at 747 mm.,  $D_4^{20} = 0.9314$ ,  $n_D^{20} = 1.41334$  (1).

Liquid with penetrating odor. — Insol. aq., eas. sol. alc., ether.

[For prepn. of  $\bar{\text{C}}$  from ethyl methyl ketone (butanone-2) (1:5405) with  $\text{Cl}_2$  in pres. of  $\text{CaCO}_3$  + aq. (yields of  $\bar{\text{C}}$  about 75% always accompanied by 25% of the isomeric 1-chlorobutanone-2 (3:8012)) see (2) (6) (7) (10) cf. (11); with  $\text{Cl}_2$  as vapor-phase chlorination see (12) (13) (14); with  $\text{Cl}_2$  diluted with dry  $\text{CO}_2$  see (15) (4); with  $\text{Cl}_2$  in sunlight see (5) (16); with  $\text{SO}_2\text{Cl}_2$  in sunlight see (5) (16) (17) cf. (11); with *N*-chlorourea in dil.  $\text{AcOH}$  see (1) (8); for prepn. of  $\bar{\text{C}}$  from acetyl chloride (3:7065) with ethylene over activated carbon at 100° and 50 atm. see (18) [note that acetyl chloride + ethylene +  $\text{AlCl}_3$  at 0° gives 4-chlorobutanone-2 (3:7640) q.v.]; for prepn. of  $\bar{\text{C}}$  from 2-chlorobutene-2 (3:7105) with  $\text{Cl}_2$  + aq. +  $\text{CCl}_4$  (65% yield) see (3).]

[ $\bar{\text{C}}$  on reduction using yeast (20) gives levorotatory 3-chlorobutanol-2, h.p. 139° (cf. 3:8000), but with  $\text{Zn} + \text{HCl}$  (15)  $\bar{\text{C}}$  yields butanone-2 (1:5405).]

$\bar{\text{C}}$  on oxidn. with conc.  $\text{HNO}_3$  (5) (16) (20) yields  $\alpha$ -chloropropionic acid (3:6125).

$\bar{\text{C}}$  on hydrolysis with aq. in s.t. at 150° for 6-8 hrs. (15), or  $\bar{\text{C}}$  with alc. alk. (15) or  $\text{MeOH/KOH}$  (21) in cold, gives (84% yield (21)) butanone-2-ol-3 (acetyl-methyl-carbinol) (acetoin)

(1:5448) (as consequence of latter reactn.  $\bar{C}$  reduces Tollens' reagt. or Fehling's soln. in cold).

$\bar{C}$  with satd. aq.  $\text{NaHSO}_3$  soln. yields (15) a  $\text{NaHSO}_3$  addn. epd.

$[\bar{C}$  with conc. aq.  $\text{KCN}$  at  $0^\circ$  for 1 hr. gives (80% yield (21)) 2,3-epoxy-2-methyl-*n*-butyronitrile ( $\alpha$ -cyano- $\alpha,\beta$ -dimethyl-ethylene oxide), b.p.  $145^\circ$ ,  $D_4^{20} = 0.9540$ ,  $n_D^{20} = 1.4079$  (21);  $\bar{C}$  with alc.  $\text{KCN}$  gives (21) a mixt. consisting mainly of the above prod. together with a little  $\alpha$ -methylacetoacetonitrile [Beil. III-2 (433)], b.p.  $182$ – $184^\circ$  at 745 mm. with slight decompn. (22), h.p.  $78^\circ$  at 19 mm. (22),  $68$ – $70^\circ$  at 12 mm. (23). (Note that the above represents a correction of the earlier views (5) (16) (24).)]

$[\bar{C}$  with conc. aq.  $(\text{NH}_4)_2\text{SO}_3$  at  $70^\circ$  yields (9) butanone-2-sulfonic acid-3.— $\bar{C}$  with  $\text{NaN}_3$  in aq. contg.  $\text{AcOH}$  yields (10) 3-azidobutanone-2, oil, h.p.  $46^\circ$  at 2 mm.]

$[\bar{C}$  with  $\text{Na}$  in abs. ether gives (15) by bimolecular coupling 3,4-dimethylhexanedione-2,5 [Beil. I-798, I-2 (409), I-2 (847)], b.p.  $210^\circ$  (15),  $82^\circ$  at 11 mm.; note therefore that sodium must not be used for drying  $\bar{C}$  cf. (24).]

$[\bar{C}$  with triethyl orthoformate (1:3241) in abs. alc. in pres. of  $\text{NH}_4\text{Cl}$  as cat. gives (70% yield in 10 days but in absence of  $\text{NH}_4\text{Cl}$  only 30% (24))  $\alpha$ -chloroethyl methyl ketone diethylacetal, h.p.  $80$ – $84^\circ$  at 36 mm.,  $D_4^{20} = 0.9773$  (24).]

$[\bar{C}$  with ethyl sodio-acetoacetate in abs. ether (4) or abs. alc. (25) (26) (24) gives (yields: 45–60% (24), 27–28% (26)) the expected ethyl  $\alpha,\beta$ -diaceto-*n*-butyrate [Beil. III-757, III-2 (265), III-2 (468)], h.p.  $150^\circ$  at 28 mm. (25),  $121$ – $124^\circ$  at 11 mm. (26). —  $\bar{C}$  with ethyl acetoacetate (1:1710) + aq.  $\text{NH}_4\text{OH}$  +  $\text{NH}_3$  gas htd. for 1 hr. gives (26% yield (4)) 3-carbomethoxy-2,4,5-trimethylpyrrole [Beil. XXII-31, XXII-1 (497)], yel. cryst. from alc. or pet. eth., m.p.  $101.5$ – $102.5^\circ$  (4),  $104$ – $105^\circ$  (27), also obtd. from the above ethyl  $\alpha,\beta$ -diaceto-*n*-butyrate with conc. aq.  $\text{NH}_4\text{OH}$  on warming (4). —  $\bar{C}$  with methyl acetoacetate (1:1705) + conc. aq.  $\text{NH}_4\text{OH}$  in the cold gives (4) methyl  $\beta$ -aminocrotonate, m.p.  $82$ – $84^\circ$  (4), which only on htg. condenses with the ester to give 3-carbomethoxy-2,4,5-trimethylpyrrole [Beil. XXII-31], cryst. from dil. alc., m.p.  $124.5$ – $126^\circ$  (4) —  $\bar{C}$  with methyl acetoacetate (1:1705) +  $\text{CH}_3\text{NH}_2$  (33% in aq.) refluxed for some hours gives only very small yield (28) of 3-carbomethoxy-1,2,4,5-tetramethylpyrrole, cryst. from lgr., m.p.  $101^\circ$  (28).]

$[\bar{C}$  with diethyl acenedicarboxylate (1:1772) in dry ether at  $-15^\circ$  treated with  $\text{NH}_3$  gas gives (10.7% yield (29)) 2-carbomethoxymethyl-3-carbomethoxy-4,5-dimethylfuran, b.p.  $110$ – $115^\circ$  at 0.2 mm. (29).]

[For condens. of  $\bar{C}$  with various phenols and phenol ethers see (30).]

$[\bar{C}$  with alc.  $\text{NH}_3$  gives (15) in the cold the difficultly isolatable 3-aminobutanone [Beil. IV-319, IV-2 (452)], but on warming this condenses bimolecularly yielding (15) (8) tetramethylpyrazine [Beil. XXIII-99, XXIII-1 (28)], nols. with  $3\text{H}_2\text{O}$  from aq., m.p.  $74$ – $77^\circ$ , but aq. lost in desic. to anhydrous prod., m.p.  $86^\circ$  (8) (corresp. picrate, m.p.  $194$ – $195^\circ$  (31)). —  $\bar{C}$  with aniline (2 moles) gives (15) on refluxing 2,3-dimethylindole [Beil. XX-319, XX-1 (130)], m.p.  $107$ – $109^\circ$  (15).]

$[\bar{C}$  with thioformamide in abs. alc. for 4 days at  $0^\circ$  gives (22% yield (17)) 4,5-dimethylthiazole, b.p.  $81$ – $83^\circ$  at 59 mm. (17) (corresp. picrate, cryst. from alc., m.p.  $186$ – $187^\circ$  (17)). —  $\bar{C}$  with  $\text{NH}_4$  dithiocarbamate in abs. alc. refluxed  $\frac{1}{2}$  hr. gives (40% yield (17)) 2-mercapto-4,5-dimethylthiazole, cryst. from  $\text{EtOAc}$ , m.p.  $163.5$ – $163.8^\circ$  (17). —  $\bar{C}$  with benzamide + powd.  $\text{CaCO}_3$  htd. at  $110$ – $120^\circ$  for 10 hrs. gives (24% yield (32)) 4,5-dimethyl-2-phenyl-oxazole [Beil. XXVII-2 (219)], m.p.  $50^\circ$ , b.p.  $128$ – $130^\circ$  at 5 mm. (32). —  $\bar{C}$  with thiobenzamide +  $\text{NaOAc}$  htd. in abs. alc. gives (65% yield (32)) 4,5-dimethyl-2-phenylthiazole, h.p.  $126$ – $128^\circ$  at 6 mm. (32).]

Ⓢ 3-Chlorobutanone-2 semicarbazone: m.p.  $143^\circ$ , or on slow htg.  $143$ – $145^\circ$  dec. (33),  $127^\circ$  (1).

B.P. 118-120° sl. dec. (1)  $D_4^{20} = 0.9513$  (1)

3:7625  $\alpha$ -CHLOROETHYL ACETATE $\text{C}_4\text{H}_7\text{O}_2\text{Cl}$ Beil. II - 152  
II<sub>1</sub>-(71)  
II<sub>2</sub>—

B.P. 121.5° at 746 mm. (sl. dec.) (1)

 $D_{15}^{15} = 1.114$  (1)

119-120° at 740 mm. (2)

119-121° at 740 mm. (3)

113-116° at 740 mm. (3) (4)

Note that the same observers have noted (3) two dif. b.p.'s, viz., 119-121° and 113-116° both at 740 mm., on dif. preps.; this anomaly is still unexplained.

[For prepn. of  $\bar{\text{C}}$  (75% yield (5)) from paraldehyde (1:0170) +  $\text{AcCl}$  (3:7065) + trace  $\text{ZnCl}_2$  see (5) (1); from acetaldehyde (1:0100) +  $\text{AcCl}$  (3:7065) at 100° see (6); from vinyl acetate + liq. (3) or gas (7)  $\text{HCl}$  see (3) (7).]

$\bar{\text{C}}$  on htg. with 0.02%  $\text{ZnCl}_2$  at 80° yields acetaldehyde (1:0100) +  $\text{AcCl}$  (3:7065) + paraldehyde (1:0170) (8);  $\bar{\text{C}}$  passed through a tube at 360-380° or over pumice at 250-300° yields acetaldehyde + acetyl chloride (9).

$\bar{\text{C}}$  with aq. slowly hydrolyzes in cold, more rapidly on warming, yielding acetaldehyde (1:0100),  $\text{AcOH}$  (1:1010), and  $\text{HCl}$ . [This hydrolysis is accelerated by trace of acid, e.g.,  $N/10$   $\text{HCl}$  (10).]

## 3:7630 1-CHLOROHXENE-1

 $\text{C}_6\text{H}_{11}\text{Cl}$ 

Beil. S.N. 11

B.P. 121-121.5° (1)

 $D_D^{22} = 0.8872$  (1)  $n_D^{22} = 1.4300$  (1)

[For formn. of  $\bar{\text{C}}$  (together with other prods.) from either 3,3-dichloropropene-1 (3:5140) or 1,3-dichloropropene-1 (3:5280) with  $n$ -propyl  $\text{MgBr}$  see (1).]

$\bar{\text{C}}$  does not react with  $\text{NaOEt}$  at 130° (1).

$\bar{\text{C}}$  readily reacts with  $\text{Na}$  yielding (1) hexene-1 (1:8255), b.p. 64°.

$\bar{\text{C}}$  adds  $\text{Br}_2$  yielding (1) 1,2-dibromo-1-chlorohexane, b.p. 107° at 13 mm.,  $D_D^{24} = 1.664$ ,  $n_D^{24} = 1.515$  (1).

3:7630 (1) Kirmann, Grard, *Compt. rend.* 190, 876-877 (1930); *Bull. soc. chim.* (4) 47, 843-847 (1930).

## 3:7640 4-CHLOROBUTANONE-2

( $\beta$ -Chloroethyl methyl  
ketone; 1-chlorobutanone-3)

Beil. I - 670

I<sub>1</sub>—  
I<sub>2</sub>-(731)

B.P. 120-122° at 760 mm. (1)

50-55° at 16 mm. (2)

53-55° at 15 mm. (8)

53° at 15 mm. (7)

50° at 15 mm. (3)

48-50° at 15 mm. (4)

[See also 3-chlorobutanone-2 (3:7598).]

Liquid with faint and not disagreeable odor.

[For prepn. of  $\bar{C}$  from methyl vinyl ketone [Beil. I-728, I<sub>1</sub>-(379), I<sub>2</sub>-(786)] satd. at 0° with HCl gas directly (67% yield (4)) or in  $C_6H_6$  soln. (5); from acetyl chloride (3:7065) with ethylene +  $AlCl_3$  at 0° (yields: 33% (3), 53% (6)) cf. (2) or at 100° and 50 atm. press. (22); from 4-chlorobutadiene-1,2 (3:7225) by cat. hydration with conc.  $H_2SO_4$  at -5° (yield 54% crude  $\bar{C}$  (1)); from  $\beta$ -chloropropionyl chloride (3:5690) with  $Zn(CH_3)_2$  (60% yield (7)); from hutanol-1-one-3 ( $\gamma$ -keto-*n*-butyl alcohol) by saturation with HCl gas at 0° espec. in pres. of 5-10%  $AlCl_3$  (63% yield (8)) see indic. refs.] — [Note that  $\bar{C}$  is not formed by chlorination of ethyl methyl ketone (butanone-2) (21).]

$\bar{C}$  with hot aq. alk. or alk. carbonates gives only resins, but  $\bar{C}$  on boil. with dimethyl-aniline or better diethylaniline loses HCl giving (yields: 30% and 80%, respectively (7)) methyl vinyl ketone (see above), h.p. 79-80°; note, however, that  $\bar{C}$  on warming with alc. KOH or quinoline loses both HCl and  $H_2O$  yielding (4) a mixt. of dienes, b.p. 65-75°.

[For behavior of potential  $\bar{C}$  (mixt. of methyl vinyl ketone + HCl gas in  $C_6H_6$ ) with ethylene glycol (1:6465) see (5); for reactn. of  $\bar{C}$  with trimethylene glycol (1:6490) + K yielding  $\gamma$ -hydroxypropyl  $\gamma$ -keto-*n*-butyl ether see (3).]

[ $\bar{C}$  with  $\beta$ -naphthol (1:1540) in EtOH/KOEt at 0° for 3 days gives (59% yield (9)) 1-( $\gamma$ -keto-*n*-butyl)naphthol-2, cryst. from aq. alc., m.p. 88-89° (corresp. semicarbazone, pale yel. pr. from MeOH, m.p. 179-180° (9)).]

[ $\bar{C}$  with 2-methylcyclohexanone (1:5470) in EtOH/NaOEt (or sodium isopropylate/isopropyl alc.) at 0° for 18 hrs. gives (yields: 15% (10), 10% (20)) 2-keto-10-methyl-2,3,4,5,6,7,8,10-octahydronaphthalene, h.p. 129-133° at 12 mm.,  $n_D^{25} = 1.5250$  (10).]

[ $\bar{C}$  with diethyl sodio-methylmalonate in ether gives (11) diethyl (methyl)-( $\gamma$ -keto-*n*-butyl)malonate, b.p. 114-110° at 0.4 mm.;  $\bar{C}$  with ethyl  $\alpha$ -isopropylacetacetate in EtOH/NaOEt as directed yields (13) ethyl  $\Delta$ -(1)*p*-menthene-3-carboxylate-4.]

[ $\bar{C}$  with aniline + conc. HCl or 40%  $H_2SO_4$  htd. with nitrobenzene or  $H_3AsO_4$  yields (14) (6) lepidine (4-methylquinoline) [Beil. XX-395, XXI<sub>1</sub>-(150)]; for corresp. reactn. with other amines see (14) (6).]

[ $\bar{C}$  with 1-aminoanthraquinone [Beil. XIV-177, XIV<sub>1</sub>-(436)] in pyridine yields (15) 1-( $\gamma$ -keto-*n*-butylamino)anthraquinone, dark red cryst. which dyc cellulose acetate.]

[ $\bar{C}$  with hydrazine hydrate in MeOH gives (80% yield (16)) (17) (19) by ring closure 3-methyl- $\Delta^2$ -pyrazoline [Beil. XXIII-30], liq., b.p. 56° at 15 mm. (16), sol. aq. but forming the corresp. picrate,  $\beta$  PkOH, yel. ndls. from alc., m.p. 153° (16) (17) (19). —  $\bar{C}$  in AcOH with methylhydrazine sulfate + NaOAc in aq stood 2 hrs. gives (18) 1,3-dimethyl- $\Delta^2$ -pyrazoline, oil, which with ethereal picric acid gives the corresp. picrate,  $\beta$ .PkOH, m.p. 131.5-132.5° (18). —  $\bar{C}$  with phenylhydrazine in ether gives (16) by ring closure 3-methyl-1-phenyl- $\Delta^2$ -pyrazoline, ndls. from ether by addn. of pet. ether, m.p. 76-77° (16).]

[ $\bar{C}$  with  $NH_2OH \cdot HCl$  +  $K_2CO_3$  in aq. MeOH htd. for a few minutes gives (20% yield (16)) by ring closure 3-methyl- $\Delta^2$ -isoxazoline [Beil. XXVII-12], oil, b.p. 60° at 15 mm. (16).]

③ 1-Carbamido-3-methyl- $\Delta^2$ -pyrazoline: ndls. from EtOAc, m.p. 167-168° (18), 167° (16). [Note that  $\bar{C}$  with 1 equiv. semicarbazide HCl + NaOAc in aq. immediately ppts. the corresp. semicarbazone; this on hgt. for 10 min. with strong aq. NaOAc (or  $\bar{C}$  + semicarbazide HCl + strong NaOAc soln. htd. directly in dil. alc. (19)) loses HCl and ring-closes to the indicated deriv.]

④ 1-Phenyl-3-methyl- $\Delta^2$ -pyrazoline: ndls. from ether on addn. of pet. eth., m.p. 76-77° (16), 77° (1). [From  $\bar{C}$  in ether with phenylhydrazine, followed by neutralization and drying with anhyd.  $K_2CO_3$  (16) (1); note that the presumably intermediate phenylhydrazone loses HCl and by ring closure gives the indicated deriv.]

44° (5)	123-126° at 14 mm. (2)	
43° (7)		
40.2° (6)		

Ndls. or lfts. from alc. — Insol. aq.; eas. sol. alc., ether.

[For prepn. of  $\bar{C}$  from phenol (1:1420) with chloroacetyl chloride (3 5235) on htg. alone (7) (6) (3), in ether soln. + pyridine (2), or with  $AlCl_3$  in  $CS_2$  (1) see indie refs.; with chloroacetic acid (3:1370) +  $P_2O_5$  in  $CHCl_3$  (8) or on htg. with  $POCl_3$  or  $ZnCl_2$  (5) see (8) (5).]

$\bar{C}$  hydrolyzes rather easily, even slowly on stdg. in moist air (3)  $\bar{C}$  on mere refluxing for  $\frac{3}{4}$  hr. with abs. alc. or with alc. NaOEt undergoes trans-esterification yielding (3) ethyl chloroacetate (3:5700) and phenol (1:1420).

$\bar{C}$  in ether treated with  $NH_3$  gas reacts vigorously yielding (3)  $NH_4$  phenolate (sol. in aq.) and chloroacetamide (insol. aq.), m p. 118° (3).

$\bar{C}$  with aniline (2 moles) at 80° for 1 hr. gives (4) aniline hydrochloride (sol. in aq.) + phenyl *N*-phenylaminoacetate [Beil. XII-471] pptd. from alc. by addn. of aq., m p. 82-83° (4). [Note that  $\bar{C}$  on boilg. with aniline yields (4) *N*-phenylaminoacetanilide (*N*-phenylglycine anilide) [Beil. XII-556], m p. 111-112° (4).]

$\bar{C}$  with phenylhydrazine (2 moles) at 50° for  $\frac{3}{4}$  hr. yields (4) phenyl  $\beta$ -phenylhydrazinoacetate [Beil. XV-321], lfts. from  $C_6H_6$  or from alc. by addn. of aq., m p. 93-94° (4).

$\bar{C}$  htd. with  $AlCl_3$  for 5 hrs. at 130-140° gives (10) *o*-hydroxyphenacyl chloride (vol. with steam), m p. 74°, + *p*-hydroxyphenacyl chloride (not vol. with steam), m p. 148°.

$\bar{C}$  + equal wt. pyridine htd. at 100° gives (1) cpd.  $\bar{C}.C_5H_5N.5H_2O$ , ndls. from alc., m p. 165-168° dec. (11), cf. (4).

**3: 7665. *d,l*-5-CHLOROHEXENE-1**  
(Biallyl hydrochloride)

B.P. 121-125° at 760 mm. (1)	$D_4^{25} = 0.8891$ (1)	$n_D^{25} = 1.4279$ (1)
120-124° (2)		
64-66° at 103 mm. (1)	$D_4^{20} = 0.9141$ (1)	$n_D^{20} = 1.4305$ (1)
43-45° at 45 mm. (1)		$n_D^{15} = 1.4332$ (1)
28-30° at 13 mm. (1)	$D_4^{12} = 0.9105$ (2)	$n_D^{12} = 1.4350$ (2)

[The levorotatory isomeride of  $\bar{C}$  has also been reported (3) from dextrorotatory hexen-1-ol-5 with  $\text{PCl}_5$  in ether, h.p. 119-122° (3); ozonolysis followed by treatment with  $\text{Br}_2/\text{aq.}$  yields (3) levorotatory  $\gamma$ -chloro-*n*-valeric acid.]

[For prepn. of  $\bar{C}$  from hexadiene-1,5 (biallyl) (1:8045) by shaking at room temp. with 5 vols. conc.  $\text{HCl}$  for 120 hrs. see (1) (4) (yield of  $\bar{C}$  is 23% accompanied by 57% 1,5-dichlorohexane (3:9340) and other products (1)); for prepn. of  $\bar{C}$  from hexen-1-ol-5 (Beil. I-444) with  $\text{PCl}_5$  in  $\text{CHCl}_3$  (30% yield + much resin (2)) see (2) (attempts to obt.  $\bar{C}$  from this alc. with  $\text{HCl}$  gave (2) as a result of ring closure only 2,5-dimethyltetrahydrofuran [Beil. XVII-14], b.p. 03°).]

$\bar{C}$  on oxidn. with  $\text{CrO}_3/\text{H}_2\text{SO}_4$  for 2½ hrs. at 90-95° gave (2) formic acid (1:1005) but no allylacetone.

**3: 7665** (1) Cortese, *J. Am. Chem. Soc.* **52**, 1519-1521 (1930). (2) Courtot, Pierron, *Compt. rend.* **190**, 1057-1059 (1930). (3) Levene, Haller, *J. Biol. Chem.* **83**, 599 (1929). (4) Wurtz, *Ann. chim.* (4) **3**, 171 (1864).

**3: 7670 3-CHLOROHEXANE**  
(*sec.*-(3)-Hexyl chloride;

**3:7660 *d,l*-3-CHLORO-2-METHYLPENTENE-1**  $C_6H_{11}Cl$  Beil. S.N. 11  
 ( $\alpha$ -Ethyl- $\beta$ -methylallyl chloride)

B.P. 120–124° (1)

Note.  $\bar{C}$  by virtue of allylic transposition would be expected to be in equilibrium with its isomeric isomer 1-chloro-2-methylpentene-2 ( $\gamma$ -ethyl- $\beta$ -methylallyl chloride). The material reported by (1) was regarded as  $\bar{C}$ ; the isomer appears to be as yet unrecorded.

[For prepn. of  $\bar{C}$  from 2-methylpenten-1-ol-3 by hgt. with  $\text{SOCl}_2$  + pyridine at 65° for 4 hrs. see (1).]

$\bar{C}$  in  $\text{MeOH}$  refluxed 4 hrs. with  $\text{NaSCN}$  gives (1)  $\alpha$ -ethyl- $\beta$ -methylallyl isothiocyanate, b.p. 100–200° nt 760 mm., 75–90° at 10 mm. (1). [This prod. with conc.  $\text{H}_2\text{SO}_4$  nt 0° yields 4-ethyl-5,5-dimethyl-2-mercaptothiazoline, color cryst. from alc., m.p. 115–118° (1).]

**3:7660** (1) Bruson, Eastes, *J. Am. Chem. Soc.* **59**, 1013 (1937).

Colorless liq. with not disagreeable odor.

[For prepn. of  $\bar{C}$  from butene-1 with  $Cl_2$  in aq. (5), in  $CCl_4$  (2), or at elevated temp. and press. in pres. of  $CaCl_2$  + other cat. (8) (some 1,2,3-trichlorobutane (3:5935) is also formed (5)) see indic. refs.; for prepn. of  $\bar{C}$  from 1-chlorobutane (3:7160) with  $Cl_2$  in sunlight or u.v. light (other isomers are also formed) see (9) (10) (11) (4) (7) (other isomers are always formed, and yield of  $\bar{C}$  is about 17% (7)) see indic. refs.; for formn. of  $\bar{C}$  from 2-chlorobutane (3:7125) with  $Cl_2$  in light see (6).]

[C with  $\text{Cl}_2$  at  $-17^\circ$  in dark gives (12) 1,2,3-trichlorobutane (3:5935) as main product.]

[C is not hydrolyzed by aq.  $K_2CO_3$  (6) but on htg. with excess 7-15% aq.  $NaHCO_3$  +  $Na_2CO_3$  at 135-195° under press. for 1-6 hrs. gives (13) butanediol-1,2 [Beil, I-477, I<sub>2</sub>-(545)] + 2-chlorobutene-2 (3:7105) + ethyl methyl ketone (1:5405) + mixt. of buten-1-ol-3 and buten-2-ol-1.]

$\bar{C}$  passed as vapor over heated soda-lime as directed (9) (4) (10) (11), or  $\bar{C}$  + aq. vapor at 200–500° over silica gel + cat. (14), gives (24.8% yield (9)) butadiene-1,3 (divinyl) [Beil. I-249, I<sub>1</sub>-(107), I<sub>2</sub>-(224)].

$\bar{\text{C}}$  with alc. KOH (1 mole + 25% excess) refluxed 3 days gives a mixt. contg. (2) cf. (18) 2-chlorobutene-1 (3:7075) + *cis*-1-chlorobutene-1 (3:7110) + *trans*-1-chlorobutene-1 (3:7110); note that by this method no butyne-1 is formed (15) and can be obtd. from  $\bar{\text{C}}$  + alc. KOH only by very drastic treatment, e.g., htg. in s.t. at 130–135° for 16–20 hrs. (15).]

[For reactn. of  $\bar{C}$  with phenylacetonitrile (benzyl cyanide) +  $\text{NaNH}_2$  in liq.  $\text{NH}_3$  giving (40% yield (16)) 1-cyano-2-ethyl-1-phenylcyclopropane, h.p.  $93-94^\circ$  at 1 mm.,  $D^{20}_D = 0.9921$ ,  $n^{20}_D = 1.52457$ , see (16); for condens. of  $\bar{C}$  with diphenyl ether (1:7125) +  $\text{AlCl}_3$  see (17).]

71.0-71.5° at 100 mm. (10)

M.P.

-20° (5)  $D_4^{20} = 1.0628$  (9)

[See also 2-chloro-2-methylpropanol-1 (3:7905).]

Colorless liq somewhat sol. aq.; 100 g. aq. at 20° dis. 18.6 g.  $\bar{C}$  (note also that 100 g.  $\bar{C}$  at 20° dis. 19 g.  $H_2O$ ) (9). —  $\bar{C}$  forms with aq. a const.-boilg. mixt., h.p. 93-94° at 760 mm., contg. 34% aq (9).

[For prepn. of  $\bar{C}$  from 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145) or from 1-chloro-2-methylpropene-1 ( $\beta,\beta$ -dimethylvinyl chloride) (3:7120) by cat. hydration of their unsatd linkage (63-66% yield) see (9) (11); note that the former with 80%  $H_2SO_4$  at 0° or the latter with 90%  $H_2SO_4$  at -10° to 0° stirred for 2½ hrs., poured onto ice, and distilled gives 63-66% of the initial chloride as  $\bar{C}$ ; note that other acids can also be used for this hydration, e.g., 85%  $H_3PO_4$ , 70%  $HNO_3$ , 60%  $HClO_4$ , benzenesulfonic acid, etc., each having its own optimum conditions (9); note also that in this process some 32-18%

respectively of the initial chloride is not hydrated but partially isomerized to a mixt. contg. 90%  $\beta,\beta$ -dimethylvinyl chloride (3:7120) + 10% methallyl chloride (3:7145) irrespective of whichever one was initially employed (9).]

[For prepn. of  $\bar{C}$  from 1,2-dichloro-2-methylpropane (isobutylene dichloride) (3:7430) by liq.-phase hydrolysis of the more reactive halogen atom under neutral (or even slightly acidic or basic) conditions (best yield 48% by refluxing 18 hrs. with aq.) see (10).]

[For prepn. of  $\bar{C}$  from chloroacetone (3:5425) or ethyl chloroacetate (3:5700) with MeMgBr (yields: 60% (5), 38% (12)) (3) (6) or MeMgI (20% yield (4)) see (3) (5) (6) (12) (note that  $\bar{C}$  is accompanied (as a result of reaction of a second MeMgBr (13) (14)) by some 2-methylbutanol-2 (1:6160)); for prepn. of  $\bar{C}$  from isobutylene with HOCl (yields: 64% (6), 63% (1), 60% (7), 47% (2)) (5) (15), with  $Cl_2 + H_2O$  (16) (17) in pres. of 10%  $CuCl_2$  (80–85% yield (24)), or with *ter*-butyl-hypochlorite (3:7165) (18) see indic. refs.; for formn. of  $\bar{C}$  from 1,2-epoxy-2-methylpropane (isobutylene oxide) (1:6117) with HCl gas in ether see (19) (6) (4) (1) (note, however, that the prod. is a mixt. consisting of about  $\frac{2}{3}$   $\bar{C}$  contaminated with about  $\frac{1}{3}$  of the isomeric 2-chloro-2-methylpropanol-1 (3:7905)).]

[For formn. of  $\bar{C}$  from 1-amino-2-methylpropanol-2 hydrochloride with conc. HCl in s.t. at 100° see (12).]

[ $\bar{C}$  on reduction with Na/Hg in dil. HCl yields (2) (15) 2-methylpropanol-1 (isobutyl alcohol) (1:6165); this unexpected result presumably is due to intermediate formation of isobutylene oxide (1:6117) which on reduction opens the ring to give isobutyl alc. (not *ter*-butyl alcohol).]

[ $\bar{C}$  on protracted oxidation, e.g., with mixt. of 1.5 wt. pts. fuming  $HNO_3$  + 3.5 wt. pts. conc.  $HNO_3$  at 75° for 20 hrs. (2), gives traces of chloroacetone (3:5425) and a little oxalic acid (1:0445) and  $\alpha$ -chloroisobutyric acid (3:0235) (5).]

$\bar{C}$  on refluxing with aq. is slowly (e.g., 56% in 14 hrs. (2)) (21) converted to isobutyraldehyde (1:0120); note that this reaction carried out above 100° under press. (20) is greatly accelerated.

[ $\bar{C}$  with warm conc. HCl yields (10) (5) 1,2-dichloro-2-methylpropane (3:7430).]

$\bar{C}$  on solution in cold 45%  $H_2SO_4$  followed by warming loses  $H_2O$  and yields (9) a mixt. consisting of about 90% 1-chloro-2-methylpropene-2 (methallyl chloride (3:7145)) accompanied by about 10% 1-chloro-2-methylpropene-1 ( $\beta,\beta$ -dimethylvinyl chloride) (3:7120); a mixt. of these two chlorides has also been obt'd. by use of  $P_2O_5$  (1) (2) or anhydrous oxalic acid (2) (22).]

[ $\bar{C}$  added dropwise to dry powdered KOH, NaOH, CaO, or  $Ca(OH)_2$  loses HCl and gives (95% yield using NaOH (10), 67% using KOH (6)) 1,2-epoxy-2-methylpropane (isobutylene oxide) (1:6117), b.p. 56.0–56.5° cf. (24).]

[ $\bar{C}$  with aq. alkali ultimately yields 2-methylpropanediol-1,2 (isobutylene glycol) (1:6446) or its polymerization products; for study of kinetics of reaction of  $\bar{C}$  with aq. alk. see (4) (8).]

[ $\bar{C}$  with KCN in 4 vols. 80% alc. refluxed for 15–20 min. gives (45–50% yield (23))  $\beta$ -hydroxy-isovaleronitrile [Beil. III-328], b.p. 210–212° at 756 mm., 130–132° at 30 mm., f.p. -12°,  $D_4^{20} = 0.96762$ ,  $n_D^{20} = 1.42911$  (23).]

[ $\bar{C}$  with aq. 23%  $Et_3NH_2$  (4 moles) in s.t. at 100° for 8 hrs. gives (70–75% yield (25)) 1-(ethylamino)-2-methylpropanol-2, b.p. 156° ( $\bar{B}.HCl$ , m.p. 151° (25)). —  $\bar{C}$  with aq.  $Et_3NH$  refluxed 3–4 hrs. gives (60% yield (26)) 1-(diethylamino)-2-methylpropanol-2, b.p. 164–165° at 761 mm. (26),  $D_4^{20} = 0.8382$  (27),  $n_D^{20} = 1.4253$  (27) ( $\bar{B}.PhOH$ , m.p. 99–100° (26)). — For reactn. of  $\bar{C}$  with *N*-methylaniline, *N*-ethylaniline, or di-*n*-butylamine see (27).]

— Chloro-*ter*-butyl acetate: b.p. 154° at 760 mm. (28), 153–154° (5),  $D_4^{15} = 1.0626$  (28),  $n_D^{15} = 1.4340$  (28). [From  $\bar{C} + AcCl$  (5); also indirectly (28% yield (28)) from

isobutylene +  $N,N'$ -dichlorourea in  $\text{AcOH.}$ —[For analogous indirect prepn. of the formate, chloroacetate, and trichloroacetate see (28).]

— Chloro-*ter*-butyl benzoate: unreported.

— Chloro-*ter*-butyl *p*-nitrobenzoate: unreported.

— Chloro-*ter*-butyl 3,5-dinitrobenzoate: unreported.

① 1-(*N*-Phthalimido)-2-methylpropanol-2 (*N*-( $\alpha$ -hydroxyisobutyl)phthalimide): ndls. or lfts. from alc., m.p. 106–107° (12). [From  $\bar{\text{C}}$  + *K* phthalimide in s.t. at 150° for 4 hrs. (60% yield (12)).]

62-66° at 56 mm. (7)

[For prepn. of  $\bar{C}$  from pentanone-2 (methyl *n*-propyl ketone) (1:5415) with  $Cl_2$  (yields: 35.5% (3), 85% crude (2)) cf. (6) or with  $SO_2Cl_2$  in  $C_6H_6$  (44% yield (7)) see indic. refs.; from ethyl  $\alpha$ -chloro- $\alpha$ -ethylacetacetate [Beil. III-694, III<sub>1</sub>-(241), III<sub>2</sub>-(438)] by ketonic cleavage with dil. HCl in s.t. at 180° for 4-6 hrs. see (1) cf. (7).]

[ $\bar{C}$  in abs. alc. treated with  $NH_3$  gas yields (2) 2,5-dimethyl-3,6-diethylpyrazine [Beil. XXIII-101], liq., b.p. 215-217°, forming with aq. a sublimable hydrate, m.p. 42.5°. (Note that 2-chloropentanone-3 (3:7935) similarly treated gives same prod.) —  $\bar{C}$  with equiv. amt. ethyl  $\beta$ -aminocrotonate [Beil. III-654, III<sub>1</sub>-(228), III<sub>2</sub>-(423)] in pres. of excess conc.  $NH_4OH$  gives (27.3% yield (4)) ethyl 2,5-dimethyl-4-ethylpyrrolecarboxylate-3 [Beil. XXII-33, XXII<sub>1</sub>-(501)], cryst. from dil. MeOH, m.p. 74-75° (4); note, however, m.p. 106-107° (5) reported for this prod. obtd. in a dif. way.]

[ $\bar{C}$  with thioformamide gives (29% yield (7)) 4-methyl-5-ethylthiazole, b.p. 169.5-170° at 745 mm., 78-79° at 25 mm. (7).]

Note 4. For details of change of refractive index with pressure see (40)

$\bar{C}$  is pract. insol. aq.; for precise data see (11) (225). —  $\bar{C}$  is very eas. sol. alc., ether,  $C_6H_6$ ,  $CHCl_3$ ,  $CS_2$ . — For detn. of  $\bar{C}$  in mixt. with  $C_6H_6$  and the dichlorobenzenes see (226) (227). — For use of  $\bar{C}$  as immersion fluid in refractometry see (228). — For toxicity of  $\bar{C}$  see (229). — For brief study of detn. of vapors of  $\bar{C}$  in air using a combustion method see (230).

Selected data and references on physical properties of mixts. of  $\bar{C}$  with other cpds (for additional data and references on many other systems see Beilstein).

Binary systems.  $\bar{C}$  with  $H_2O$  forms a const.-boilg. mixt., b.p. 90.2° at 760 mm., contg; 71.6%  $\bar{C}$  (41) (use in sepn. of  $\bar{C}$  from polychlorobenzenes see (69));  $\bar{C}$  with acetone (1:5400).

nitrobenzene, f.p./compn. data + diagram (eutectic, m.p.  $-50.7^{\circ}$  contg. 78.3 wt. %  $\bar{C}$ ) see (21);  $\bar{C}$  with pyridine, f.p./compn. data + diagram (eutectic, m.p.  $-63.5^{\circ}$ , contg. 54%  $\bar{C}$ ) and also  $n_D^{25}$ /compn. diag. see (28);  $\bar{C}$  with *o*-chlorotoluene (3:8245), f.p./compn. diagram (eutectic, m.p. abt.  $-71^{\circ}$ , contg. 39.4 mole %  $\bar{C}$ ) see (44);  $\bar{C}$  with *m*-dichlorobenzene (3:5960), f.p./compn. data, see (23);  $\bar{C}$  with benzoyl chloride (3:6240), f.p./compn. data see (45);  $\bar{C}$  + ethylene dibromide, f.p./compn. diag. (eutectic; m.p.  $-55^{\circ}$  contg. 83 mole %  $\bar{C}$ ) see (44); vapor-press. equil. see (46);  $\bar{C}$  + bromobenzene, f.p./compn. diagram (no eutectic) see (22) (24); for use in testing efficiency of distillation columns see (39);  $\bar{C}$  + iodobenzene, f.p./compn. diagram (eutectic, m.p.  $-51.5^{\circ}$ , contg. 57%  $\bar{C}$ ) see (22) (24);  $\bar{C}$  with fluorobenzene, f.p./compn. diagram (complex system) see (22) (24).

Ternary Systems.  $\bar{C}$  with aq. + HCl forms ternary const.-boilg. mixt., b.p.  $96.6^{\circ}$  at 756 mm., contg. 74.5 wt. %  $\bar{C}$  + 20.2 wt. % aq. + 5.3 wt. % HCl (41);  $\bar{C}$  with aq. + acetone, solubility diagram see (47);  $\bar{C}$  + ethylene glycol (1:6465) + acetone, soly. of system at  $23^{\circ}$  see (48).

Preparation of  $\bar{C}$ . Because of the magnitude of the literature on this topic only a few selected references can be given here; reference should also be made to Beil. V-199, VI-(109) and V<sub>2</sub>-(148).

[For prepn. of  $\bar{C}$  from  $C_6H_6$  with  $Cl_2$  in pres. of  $SnCl_4$  at  $30-40^{\circ}$  (49), with  $NOCl$  at  $425^{\circ}$  (50), with  $HCl$  +  $O_2$  (air) + cat. (51) see indic. refs.; for discussion of prepn. of industrial  $\bar{C}$  see (52); for study of photochem. chlorination of  $C_6H_6$  see (53).]

[For prepn. of  $\bar{C}$  from aniline via formn. of benzenediazonium chloride/ $ZnCl_2$  cpd. and btg. with molten phenol (40% yield  $\bar{C}$  + 26% hydroxybiphenyl + 20% diphenyl ether (54)) or by isolation of solid benzene diazonium chloride and cautious decompn. by warming in various org. solvents see (55); from *p*-chloroaniline via formn. of *p*-chlorobenzenediazonium chloride/ $ZnCl_2$  cpd. and btg. latter with EtOH (67% yield) or EtOH + Zn dust (60% yield) see (54); from phenylhydrazine by oxidn. with aq.  $FeCl_3$  at  $70^{\circ}$  (61% yield) or with  $HClO_3$  (30% yield) see (56); from  $C_6H_5SO_2Cl$  (60% yield (57)), sulfonyl chloride (57), (57)), other aromatic sulfonyl chlorides ( . . . . . amines (59), or *N*-chloro-*p*-chlorobenzaldimine (60), see indic. refs.]

[For formn. of  $\bar{C}$  from benzoyl chloride (3:6240) on htg. in porcelain tube at  $550-600^{\circ}$  see (61); from benzeneazotriphenylmethane on warming in  $CCl_4$  see (62); from bis-(*p*-chlorophenyl)zinc by reaction with aq. see (63); from phenylboric acid with  $Cl_2$ /aq. or refluxed with aq.  $CuCl_2$  (85% yield) see (64); from  $C_6H_6$  + *n*-butyl chlorosulfonate +  $AlCl_3$  (11% yield) see (65); from  $C_6H_6$  with  $SeCl_4$  +  $AlCl_3$  see (66); from 4-chlorodiphenyl sulfide by htg. with sulfur see (67); from 2-chlorobenzophenone (3:0715) or 4-chlorobenzophenone (3:1914) on fusion with  $KOH/NaOH$  see (68).]

Pyrolysis.  $\bar{C}$  passed over Pt wire at bright red heat (70) or through hot Fe tube (71) yields 4,4'-dichlorobiphenyl (3:4300) accompanied by biphenyl (1:7175), 4-chlorobiphenyl (3:1912), and other products.

Reduction.  $\bar{C}$  in EtOH at  $55^{\circ}$  with excess  $H_2$  at 3 atm. in pres. of Adams' cat. readily (72) yields cyclohexane (1:8405). —  $\bar{C}$  with  $H_2$  or  $NH_2.NH_2$  in MeOH or EtOH in pres. of  $Pd/CaCO_3$  gives (73) cf. (74) small yields of biphenyl (1:7175). —  $\bar{C}$  with Na in boilg. EtOH (75), or Na/Hg in EtOH (76), or Na in AmOH (77), or NaOAm in AmOH (78) is debrominated, but extent of reactn. varies with conditions. —  $\bar{C}$  with HI + P is unaffected at  $300^{\circ}$  but at  $375^{\circ}$  yields (79) benzene. —  $\bar{C}$  in aq. or dil. alc. alk. with  $H_2$  in pres. of Ni

splits off all (80) its halogen as HCl. —  $\bar{C}$  with  $H_2 + Ni$  at  $270^\circ$  yields (81) benzene + biphenyl.

Behavior with chlorine.  $\bar{C}$  with  $Cl_2$  may add or substitute or both according to conditions. —  $\bar{C}$  under dil. aq. NaOH with excess  $Cl_2$  in sunlight (82) or with  $Cl_2$  at  $0^\circ$  in dark as directed (83) (84) gives (90% yield (83)) heptachlorocyclohexane [Beil. V-23,  $V_2$ -(12)] (known in 2 stereoisomeric forms, " $\alpha$ ," m.p.  $146^\circ$  (82), " $\beta$ ," m.p.  $260^\circ$  (82)). [For study of relative amts. addition and substitution with  $\bar{C} + Cl_2$  see (85).]

$\bar{C}$  with  $Cl_2$  in pres. of  $AlCl_3$  (86),  $Al/Hg$  (87), or  $FeCl_3$  (88), or  $\bar{C}$  with  $SO_2Cl_2 + S_2Cl_2 + AlCl_3$  (89), or  $\bar{C}$  htd. with  $FeCl_3$  (89) or  $PbCl_2 \cdot 2NH_4Cl$  (90), gives mainly 1,4-dichlorobenzene (3:0980) accompanied by other products. —  $\bar{C}$  with  $Cl_2$  at  $400$ – $700^\circ$  in pres. of cat. yields (91) (92) 1,3-dichlorobenzene (3:5960) + 1,3,5-trichlorobenzene (3:1400) and other products.

Behavior with bromine.  $\bar{C}$  with  $Br_2$  (93) under aq (82) or in pres. of  $AlCl_3$  (94),  $Al/Hg$  (95),  $Al$  (99), or  $Fe$  (99), or  $\bar{C}$  htd. with  $FeBr_3$  (96), gives mainly 4-bromochlorobenzene [Beil. V-209,  $V_1$ -(116),  $V_2$ -(162)], m.p.  $66^\circ$ , together with other products; for study of rate in  $AcOH$  see (97). —  $\bar{C}$  with  $Br_2$  at elevated temp gives greatly increased proportion of meta-bromochlorobenzene; e.g.,  $\bar{C}$  with  $Br_2$  at  $475^\circ$  gives (98) 53% *m*-, 27% *p*-, and 20% *o*-bromochlorobenzenes.

Behavior with metals.  $\bar{C}$  with  $Li$  in dry ether under dry  $N_2$  gives (35–49% yield (100)) phenyllithium [Beil. XVI-1-(589)]; for reactns. of latter with fluoro, chloro, bromo, or iodobenzene see (101).

$\bar{C}$  on boilg. with  $Na$  yields (102)  $C_6H_6$ , biphenyl, and other products;  $\bar{C}$  with  $Na$  in boilg. toluene yields mainly (102)  $C_6H_6$  together with other prods. —  $\bar{C}$  with amylsodium (from amyl chloride +  $Na$ ) in lgr. gives (103) (104) (105) phenylsodium [Beil. XVI-1-(589)] which with  $CO_2$  gives (105) benzoic acid;  $\bar{C}$  with  $Na +$  diethyl carbonate in  $C_6H_6$  gives (79% yield (106)) (for use of other esters such as methyl benzoate, ethyl benzoate, or diethyl oxalate in ether see (107)) or  $\bar{C}$  with  $Na +$  benzophenone in  $C_6H_6$  gives (98% yield (106)) (108) triphenylcarbinol (1:5985). —  $\bar{C}$  with  $Na + AsCl_3$  in xylene gives (82% yield (109)) triphenylarsine,  $\bar{C}$  with  $Na + SbCl_3$  in xylene yields (109) triphenylstibine.

$\bar{C}$  with  $Mg/Cu$  alloy in pres. of  $I_2$  (110), or  $\bar{C}$  with  $Mg$  in s.t. at  $150$ – $160^\circ$  for 3 hrs. (111) (112), or  $\bar{C}$  refluxed with  $Mg + Cu_2Cl_2$  (113), gives (yields. 80% (110), 85% (111)) phenyl magnesium chloride.

Behavior with Al halides.  $\bar{C}$  does not react with  $AlCl_3$  even on long boilg. (dif. from bromobenzene and iodobenzene which react at once) (114). —  $\bar{C}$  with freshly prepared fused  $AlBr_3$  yields (115) bromobenzene.

Behavior with  $AlCl_3 +$  other compounds.  $\bar{C}$  (2 moles) with  $CCl_4$  (1 mole) +  $AlCl_3$  (1.75 moles) in  $CS_2$  gives (116) (117) bis-(4-chlorophenyl)dichloromethane [Beil. V-592], m.p.  $52$ – $53^\circ$ , together with other products;  $\bar{C}$  (6 moles) with  $CCl_4$  (1 mole) +  $AlCl_3$  (1 mole) htd. at  $60$ – $70^\circ$  gives mainly (118) 2-chlorophenyl-bis-(4-chlorophenyl)chloromethane [Beil. V-703], m.p.  $153^\circ$ , accompanied by a small amt. *trans*-(4-chlorophenyl)chloromethane [Beil. V-703], m.p.  $113^\circ$ .

$\bar{C}$  with  $AcCl$  (3:7065) or  $Ac_2O + AlCl_3$  yields *p*-chloroacetophenone (3:6735) q.v. for details.

$\bar{C} +$  furoic acid (1:0475) +  $AlCl_3$  gives (18% yield (119)) 6-chloronaphthoic acid-1 (3:4845);  $\bar{C} +$  methyl furoate (1:3452) +  $AlCl_3$  gives in good yield (120) methyl 6-chloro-1-naphthoate.

$\bar{C}$  with phthalic anhydride (1:0725) +  $AlCl_3$  gives (121) (122) (123) (124) *o*-(4-chlorobenzoyl)benzoic acid [Beil. X-750,  $X_1$ -(336)], m.p.  $147$ – $148^\circ$ , which on ring closure with

conc.  $\text{H}_2\text{SO}_4$  yields 2-chloroanthraquinone (3:4922) q.v. [For corresp. reactns. of  $\bar{\text{C}}$  with 4-bromophthalic anhydride (125), 4-sulfaphthalic anhydride (126), naphthalene-1,2-dicarboxylic acid anhydride (127), or naphthalene-2,3-dicarboxylic acid anhydride (128) see indic. refs.]

Miscellaneous condensations.  $\bar{\text{C}}$  with acetylene +  $\text{AlCl}_3$  gives (129) 1,2-bis(4-chlorophenyl)ethane (4,4'-dichlorodiphenyl) + other prods., cf. also (130). —  $\bar{\text{C}}$  with propylene in pres. of sulfonic acids at 86–130° gives (131) isopropylbenzene (cumene) (1:7440). —  $\bar{\text{C}}$  + hexene-3 +  $\text{H}_2\text{F}_2$  gives (25% yield (132)) 4-chloro-(1'-ethylbutyl)benzene. —  $\bar{\text{C}}$  + cyclohexene + conc.  $\text{H}_2\text{SO}_4$  gives (50% yield (133)) 4-chlorophenylcyclohexane. —  $\bar{\text{C}}$  + allyl chloride (3:7035) + conc.  $\text{H}_2\text{SO}_4$  gives (133) 1-chloro-2-(*p*-chlorophenyl)propane.

$\bar{\text{C}}$  + isopropyl alc. with 80%  $\text{H}_2\text{SO}_4$  at 70° gives (72% yield (134)) 4-chloro-isopropylbenzene (3:8705). —  $\bar{\text{C}}$  with *ter*-butyl alc. +  $\text{AlCl}_3$  gives (135) 4-chloro-*ter*-butylbenzene;  $\bar{\text{C}}$  with *ter*-amyl alc. +  $\text{AlCl}_3$  gives (135) 4-chloro-*ter*-amylbenzene.

$\bar{\text{C}}$  +  $\text{CO}$  +  $\text{AlCl}_3$  +  $\text{TiCl}_4$  at 60 atm. and 30–35° (136) or  $\bar{\text{C}}$  +  $\text{HCN}$  +  $\text{AlCl}_3$  at 100° for 6 hrs. (137) gives *p*-chlorobenzaldehyde (3:0765). —  $\bar{\text{C}}$  +  $\text{CO}$  + cat. + steam at 300–400° (138) (139) gives benzoic acid. —  $\bar{\text{C}}$  with paraformaldehyde +  $\text{ZnCl}_2$  (140) (142) or  $\bar{\text{C}}$  with formalin +  $\text{HCl}$  (141) or  $\bar{\text{C}}$  with chloromethyl methyl ether (3:7085) +  $\text{ZnCl}_2$  (142) or  $\bar{\text{C}}$  with bis-(chloromethyl) ether (3:5245) +  $\text{ZnCl}_2$  (142) yields *p*-chlorobenzyl chloride (3:0220) q.v. —  $\bar{\text{C}}$  with *p*-chlorobenzyl chloride (3:0220) +  $\text{H}_2\text{SO}_4$  yields (142) 4,4'-dichlorodiphenylmethane.

$\bar{\text{C}}$  with chloral (3:6210) or chloral hydrate (3:1270) + conc. or fuming  $\text{H}_2\text{SO}_4$  gives 1,1,1-trichloro-2,2-bis-(*p*-chlorophenyl)ethane ("DDT") (3:3298) q.v.

Hydrolysis.  $\bar{\text{C}}$  is unaffected by protracted boilg. with aq. or even alc. alk.; however, by use of increased temp. and press. especially in pres. of catalysts the hydrolysis of  $\bar{\text{C}}$  constitutes an extremely important industrial process for manufacture of phenol.

For general studies on the catalytic hydrolysis of  $\bar{\text{C}}$  to phenol with steam at elevated temperatures see (143) (144) (145) (146); for patents employing this method see (147)–(159) incl. — For résumé of prepn. of phenol via Raschig method ( $\text{C}_6\text{H}_6$  +  $\text{HCl}$  +  $\text{O}_2$  to  $\bar{\text{C}}$  with subsequent hydrolysis) see (160); for relevant patents see (161) (162) (163). — For sepn. of products of hydrolysis see (41) (164).

$\bar{\text{C}}$  may also be hydrolyzed to phenol by means of aq.  $\text{NaOH}$ ,  $\text{Ca}(\text{OH})_2$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{NaHCO}_3$ , etc., at elevated temp. and press. especially in pres. of catalysts, notably copper: for impt. general review of these methods up to 1927 see (165); for general discussion see (166); for recent patents on this process and its variants see (167)–(182) incl. — For conv. of  $\bar{\text{C}}$  with alk. to 4-hydroxybiphenyl (1:1585) see (183) or to diphenyl ether (1:7125) see (184) (185) (186).

$\bar{\text{C}}$  htd. with aq.  $\text{Na}_2\text{S}$ ,  $\text{NaSH}$ , or  $\text{H}_2\text{S}$  under press. gives (187) (188) (189) (190) diphenyl sulfide and/or thiophenol. —  $\bar{\text{C}}$  +  $\text{H}_2\text{S}$  + cat. at 700° gives (191) thiophenol.

[For use of  $\bar{\text{C}}$  in prepn. of sulfur dyes by htg. with sulfur see (192) (193).]

Ammonolysis.  $\bar{\text{C}}$  with dry  $\text{NH}_3$  does not react even in pres. of  $\text{Cu}$  +  $\text{I}_2$  and high temp. and press. (194). — However,  $\bar{\text{C}}$  with conc. aq.  $\text{NH}_4\text{OH}$  htd. at high temp. and press. especially in pres. of  $\text{Cu}$ ,  $\text{Cu}$  cpds., or other cat. yields aniline and/or diphenylamine; for general discussion of this reactn. see (195) (196) (197) (198) (199); for illustrative patents see (200)–(208) incl.; for purification of reactn. prod. see (209) (210). — For behavior of  $\bar{\text{C}}$  with  $\text{Na}$  in liq.  $\text{NH}_3$  (211) and its use in detn. of halogen content of  $\bar{\text{C}}$  (212) see indic. refs. — For behavior of  $\bar{\text{C}}$  with  $\text{KNH}_2$  in liq.  $\text{NH}_3$  see (213) (214).

Nitration.  $\bar{\text{C}}$  on mononitration, e.g., with mixt. of 10 ml.  $\text{HNO}_3$  ( $D = 1.52$ ) + 50 ml.  $\text{HNO}_2$  ( $D = 1.48$ ) for 25 g.  $\bar{\text{C}}$  at 0° (215), gives a prod. contg. 69.9% *p*-chloronitrobenzene [Beil. V-243,  $V_1$ -(130),  $V_2$ -(183)], m.p. 82°, together with 29.8% *o*-chloronitrobenzene [Beil. V-241,  $V_1$ -(129),  $V_2$ -(180)], m.p. 32°; the *p/o* ratio is but little different at –30°;

3:0590 *p*-CHLOROPHENYLACETYLENE $C_8H_7Cl$ 

Beil. S.N. 474

3:7917	<i>d,l</i> -2-CHLOROPROPANOL-1 (Propylene $\beta$ -chlorohydrin; $\beta$ -chloro- <i>n</i> -propyl alcohol)	$\text{CH}_3-\underset{\text{Cl}}{\text{CH}}-\underset{\text{OH}}{\text{CH}_2}$	$\text{C}_3\text{H}_7\text{OCl}$	Beil. I - 356 I <sub>1</sub> -(180) I <sub>2</sub> -(369)
B.P. 133-134°	cor. at 762 mm. (1)	$D_{20}^{20} = 1.103$	(1)	$n_D^{20} = 1.43023$ (1)
133-134°	at 761 mm. (2)			
133-134°	at 760 mm. (3)	$D_{15}^{15} = 1.4505$	(9)	$n_D^{15} = 1.4766$ (9)
133°	(10)			
94°	at 8 mm. (9)			

[See also 1-chloropropanol-2 (3:7747).]

[For prepn. of  $\bar{\text{C}}$  from its acetate (see below) by alcoholysis with excess boilg. dry MeOH for 8 hrs. (83% yield) see (1); note that this prepn. really starts from the isomeric 1-chloropropanol-2, the conversion of which to  $\bar{\text{C}}$  involves the following steps: reaction with KOAc yielding  $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2(\text{OAc})$ , conversion of latter with  $\text{HCl} + \text{ZnCl}_2$  to  $\text{CH}_3\text{CH}(\text{Cl})\text{CH}_2(\text{OAc})$ , and finally alcoholysis to  $\bar{\text{C}}$  as mentioned above (1) (4); for formn. of  $\bar{\text{C}}$  by alk. hydroly. of its trichloroacetate see (9) ]

[Note that although  $\bar{\text{C}}$  is formed in other ways (e.g., from propanediol-1,2 (propylene glycol) (1:6455) with  $\text{HCl}$  or  $\text{S}_2\text{Cl}_2$  (5), from 2,3-epoxybutane (propylene oxide) (1:6115) by addn. of  $\text{HCl}$  (5), from propylene with  $\text{HOCl}$  (5), or from  $\alpha$ -chloro-*n*-propylamine with  $\text{HNO}_2$  (6)) the product of these reactions appears to be (5) (6) an inseparable mixt. of about 40%  $\bar{\text{C}}$  with 60% of the isomeric 1-chloropropanol-2 (3:7747).]

Reactions of the halogen atom of  $\bar{\text{C}}$ . [ $\bar{\text{C}}$  when added dropwise to conc. aq. KOH loses  $\text{HCl}$  yielding (1) 2,3-epoxybutane (propylene oxide) (1:6115), b.p. 35°. —  $\bar{\text{C}}$  with KCN in 80% alc. contg. some NaI gives on warming (60% yield (2))  $\beta$ -hydroxy-*n*-butyronitrile [Beil. III-309, III<sub>2</sub>-(221)], b.p. 214-215° (2); note that this is not the product to be expected from simple replacement of Cl by CN and apparently results from preliminary formation of propylene oxide to which HCN then adds so as to give a straight (rather than forked) carbon chain.]

Reactions of the OH group of  $\bar{\text{C}}$ . [ $\bar{\text{C}}$  reacts normally as a substituted primary alc. giving ethers, esters, oxidn. products, etc.]

[ $\bar{\text{C}}$  readily gives the corresp. ethers; e.g.,  $\bar{\text{C}}$  with  $\text{Me}_2\text{SO}_4$  on warming gives (7)  $\beta$ -chloro-*n*-propyl methyl ether, b.p. 98-99° at 756 mm.,  $D_{15}^{20} = 0.9946$ ,  $n_D^{20} = 1.40754$  (7);  $\bar{\text{C}}$  with  $\text{EtOH} + \text{conc. H}_2\text{SO}_4$  on htg. gives (54% yield (7))  $\beta$ -chloro-*n*-propyl ethyl ether, b.p. 116-117° at 758 mm.,  $D_{15}^{20} = 0.9828$ ,  $n_D^{20} = 1.41285$  (7); for corresp. formn. of ethers with *n*-propyl alc. (1:6150) and with allyl alc. (1:6145) see (7).]

[ $\bar{\text{C}}$  (1 mole) with  $\text{SO}_2\text{Cl}_2$  (2.5 moles) at 130° gives (16% yield (7)) bis-( $\beta$ -chloro-*n*-propyl) ether, b.p. 188° at 762 mm.,  $D_{15}^{20} = 1.109$ ,  $n_D^{20} = 1.4467$  (7); note that this ether is not obtd. from  $\bar{\text{C}}$  with conc.  $\text{H}_2\text{SO}_4$  (7).]

[ $\bar{\text{C}}$  on oxidn. with 3 wt. pts. conc.  $\text{HNO}_3$  as directed (8) (2) gives (85% yield (2))  $\alpha$ -chloropropionic acid (3:6125), accompanied by some acetic acid (1:1010) and oxalic acid (1:0445); note that  $\bar{\text{C}}$  on oxidn. with chromic acid yields no  $\alpha$ -chloropropionic acid but only acetic acid (1:1010) and formic acid (1:1005) (2).]

—  $\beta$ -Chloro-*n*-propyl acetate [Beil. II-129, II<sub>1</sub>-(58), II<sub>2</sub>-(139)]: oil, insol. aq., b.p. 151-152° at 768 mm. (11), 152-153° at 750 mm. (1). [Prepd. indirectly; furthermore the prods. reported may be contaminated with some of the isomeric  $\beta$ -chloroisopropyl acetate cf. (10).]

—  $\beta$ -Chloro-*n*-propyl benzoate: unreported.

—  $\beta$ -Chloro-*n*-propyl *p*-nitrobenzoate: unreported.

—  $\beta$ -Chloro-*n*-propyl 3,5-dinitrobenzoate: unreported.

for f.p./compa curve of system *p*-chloronitrobenzene/*o*-chloronitrobenzene (eutectic, m.p. 14.7°, contg. 33.1% *p*-isomer) see (215). — For mononitration using 0.9 g. of 70%  $\text{HNO}_3$  + 1.29 g. 94%  $\text{H}_2\text{SO}_4$  per gram of  $\bar{\text{C}}$  (216) or using nitrosulfonic acid (from fung.  $\text{HNO}_3$  treated with  $\text{SO}_2$ ) at 30° (217) or using  $\text{Fe}(\text{NO}_3)_3$  in  $\text{Ac}_2\text{O}$  at 40–45° (218) see indic. refs. — Note that no appreciable amt. of *m*-chloronitrobenzene is formed by direct nitration of  $\bar{\text{C}}$ .

$\bar{\text{C}}$  on dinitration, e.g., with 5 wt. pts. of a mixt. consisting of equal wts. of 92.8%  $\text{HNO}_3$ , 93.3%  $\text{H}_2\text{SO}_4$ , and fung.  $\text{H}_2\text{SO}_4$  (contg. 14.2%  $\text{SO}_3$ ) at 95° for 2 hrs. (219) gives 96.7% yield 2,4-dinitrochlorobenzene [Beil. V-263, V-(137),  $\text{V}_2$ -(196)], cryst. from alc., m.p. 52–53°. [The other dinitro isomers are known but need not be discussed here.]

Sulfonation.  $\bar{\text{O}}$  is insol. in cold conc.  $\text{H}_2\text{SO}_4$ ; however,  $\bar{\text{C}}$  on warming or on stdg. at room temp. for 48 hrs. (220) with equal wt. conc.  $\text{H}_2\text{SO}_4$  dissolves and later ppts. *p*-chlorobenzenesulfonic acid [Beil. XI-54, XI-(14)], anhydrous cryst. from  $\text{CHCl}_3$ , m.p. 92–93° (220), monohydrate from aq., m.p. 67° (221). —  $\bar{\text{C}}$  with fung.  $\text{H}_2\text{SO}_4$  (10%  $\text{SO}_3$ ) below 60° for 1 hr. then poured into 6 vols. satd. aq.  $\text{NaCl}$  soln. gives (222) (223) sodium salt of *p*-chlorobenzenesulfonic acid which with  $\text{PCl}_5$  yields corresp. sulfonyl chloride (see below). — For reactn. of  $\bar{\text{C}}$  with  $\text{ClSO}_3\text{H}$  see below. — [The corresp. bis-(4-chlorophenyl) sulfone [Beil. VI-327, VI-(149)] which may be formed in small amt. has m.p. 147–148°.] [For study of kinetics of sulfonation of  $\bar{\text{C}}$  see (231).]

① *p*-Bromochlorobenzene:  $\bar{\text{C}}$  with 0.25–0.50 mole  $\text{Br}_2$  at 60° in pres. of  $\text{Fe}$  gives (88% yield (99)) *p*-bromochlorobenzene, cryst. from alc., m.p. 67–68°.

② 2,4-Dinitrochlorobenzene:  $\bar{\text{C}}$  on htg. with mixt. of  $\text{HNO}_3$  +  $\text{H}_2\text{SO}_4$  (see above under nitration) at 95° for 2 hrs. gives (96.7% yield (219)) 2,4-dinitrochlorobenzene, cryst. from alc., m.p. 52–53°.

③ 4-Chlorobenzenesulfonamide:  $\bar{\text{C}}$  with  $\text{ClSO}_3\text{H}$  in  $\text{CHCl}_3$  as directed (224) gives 4-chlorobenzenesulfonyl chloride, cryst. from dry ether, m.p. 53°, which by boilg. with conc.  $\text{NH}_4\text{OH}$  or htg. with solid  $(\text{NH}_4)_2\text{CO}_3$  for 30 min. at 100° gives 4-chlorobenzenesulfonamide, cryst. from dil. alc., m.p. 142–143° u.c. (224).

### 3:7935 2-CHLOROPENTANONE-3

( $\alpha$ -Chloroethyl ethyl ketone;  
 $\alpha$ -chlorodiethyl ketone)

B.P. 135° (1) (2)

145° (3)

Oil, insol. aq., sol. alc., ether.

[For prepn. of  $\bar{\text{C}}$  from pentanone-3 (diethyl ketone) (1:5420) with  $\text{Cl}_2$  (3) (4), with  $\text{Cl}_2$  in pres. of aq. +  $\text{CaCO}_3$  (86% yield (1)), or with  $\text{Cl}_2$  in vapor-phase chlorination (4) see indic. refs.; from 4-chloro-4-methyl-3-ethylisoxazolone-5 [Beil. XXVII-163] with hydrochloric acid see (2).]

$\bar{\text{C}}$  on reduction with  $\text{H}_2$  yields (3) pentanone-3 (1:5420).

$\bar{\text{C}}$  does not (3) form a cpd. with satd. aq.  $\text{NaHSO}_3$  soln.

$\bar{\text{C}}$  dis. readily in aq. alk. yielding a soln. (presumably contg. pentanone-3-ol-2) which readily reduces  $\text{NH}_4\text{OH}/\text{AgNO}_3$  and reduces Fehling's soln. on warming (3).

[ $\bar{\text{C}}$  in abs. alc. treated with  $\text{NH}_3$  gas yields (3) 2,5-dimethyl-3,6-diethylpyrazine [Beil. XXIII-101], liq., b.p. 215-217°, forming with aq. a sublimable hydrate, m.p. 42.5°. (Note that 3-chloropentanone-2 (3:7893) similarly treated gives the same prod.)]

— 2-(Phthalimido)propanol-1 (*N*-( $\beta$ -hydroxyisopropyl)phthalimide): lfts. from EtOAc m.p. 99–101° (10). [Prepd. indirectly (10); note that the prod. obtd. (10) from  $\bar{C}$  with K phthalimide in a.t. at 200–230° was the isomeric 1-(phthalimido)propanol-2, m.p. 88–89° (10), but whether this result was due to contamination of  $\bar{C}$  with the isomeric 1-chloro-propanol-2 (3:7747) or the rearr. has never been clarified.]

## 3:7985 5-CHLORO-2-METHYLHEXANE

(Isoamyl-methyl-carbinyl  
chloride)

Beil. I - 156

I<sub>1</sub>—I<sub>2</sub>—

B.P. 138° dec. at 735 mm. (1)  
135-137° (2)

 $D_4^{20} = 0.863$  (1)

[For prepn. of  $\bar{\text{C}}$  from 2-methylhexanol-5 (isoamyl-methyl-carbinol) [Beil. I-416, I-(206), I<sub>1</sub>-(445)] by saturation with dry HCl and stdg. for 6 weeks (90% yield (1)) or htg. in s.t. at 140° (2) see indic. refs.]

$\bar{\text{C}}$  on conversion with Mg in dry ether to RMgCl and treatment with O<sub>2</sub> gives (60% yield (1)) 2-methylhexanol-5, b.p. 151-152° at 736 mm.,  $n_D^{20} = 1.4180$  (*N*-( $\alpha$ -naphthyl)-carbamate), m.p. 84-85° (1).

3:7985 (1) Whitmore, Johnston, *J. Am. Chem. Soc.* **60**, 2267 (1938). (2) Rohn, *Ann.* **190**, 312-313 (1877).

## 3:7988 2-CHLOROHEPTENE-1

 $\text{C}_7\text{H}_{13}\text{Cl}$ 

Beil. S.N. 11

B.P. 138-139° at 748 mm. (1)  
71-72° at 75 mm. (1) (2)

 $D_4^{24} = 0.8788$  (1) $n_D^{24} = 1.4302$  (1) $D_4^{20} = 0.8895$  (2) $n_D^{20} = 1.4340$  (2)

[For prepn. of  $\bar{\text{C}}$  from *n*-amyl methyl ketone (heptanone-2) (1:5460) with PCl<sub>5</sub> in C<sub>6</sub>H<sub>6</sub> (40% yield together with 23% yield 2,2-dichloroheptane (3:9424)) see (2); for prepn. from heptyne-1 (1:8085) + AcCl + SnCl<sub>4</sub> see (2) (both *cis*-4-chlorononen-3-one-2, b.p. 99° at 10 mm.,  $D_4^{25} = 0.9830$ ,  $n_D^{25} = 1.4607$ , and *trans*-4-chlorononen-3-one-2, b.p. 89° at 10 mm.,  $D_4^{25} = 0.9752$ ,  $n_D^{25} = 1.4565$  are also formed (1)).]

$\bar{\text{C}}$  with powdered KOH in mineral oil at 250° does not (2) yield heptyne-1 (dif. from 1-chloroheptene-1 (3:8219)).

3:7988 (1) Kroeger, Sowa, Nieuwland, *J. Org. Chem.* **1**, 163-169 (1936). (2) Bachmann, Hill, *J. Am. Chem. Soc.* **56**, 2730-2732 (1934).

3:7990  $\alpha$ -ETHYL-*n*-BUTYRYL CHLORIDE

(Diethylacetyl chloride)

Beil. II - 334

II<sub>1</sub>—II<sub>2</sub>-(292)

B.P. 138.0-138.8° at 750 mm. (1)  
134-137° (2)  
71° at 88 mm. (3)  
40° at 20 mm. (3)

 $D_4^{20} = 0.9825$  (1) $n_D^{20} = 1.4234$  (3);

1.4239 (3)

 $D_4^0 = 0.9992$  (1)

[For prepn. of  $\bar{\text{C}}$  from 2-ethylbutanoic acid (1:1115) with PCl<sub>5</sub> (2), or with SOCl<sub>2</sub> (1) (85-90% yield (3)) see indic. refs.]

(isopentane) (1:8500) (4) (10) or from 2-chloro-2-methylbutane (*ter*-amyl chloride) (3:7220) (11) with  $\text{Cl}_2$  see indic. refs.; for formn. of  $\tilde{\text{C}}$  from 2-methylbutene-1 (unsym.-ethyl-methyl-ethylene (1:8210) +  $\text{Cl}_2$  see (12); for formn. of  $\tilde{\text{C}}$  from 3-chloro-2-methylbutene-1 (3:7300) +  $\text{HCl}$  see (3); for formn. of  $\tilde{\text{C}}$  from 2-methylbutanol-2 (*ter*-amyl alcohol) (1:6160) +  $\text{Cl}_2$  see (1).]

[ $\tilde{\text{C}}$  on further chlorination yields (3) 2,3,3-trichloro-2-methylbutane (3:4755) together with other prods.]

$\tilde{\text{C}}$  on htg. with solid  $\text{KOH}$  (3) or with alc.  $\text{KOH}$  (3) (4) loses  $\text{HCl}$  yielding 3-chloro-2-methylbutene-2 (3:7335) and other prods. — [ $\tilde{\text{C}}$  on passing over soda-lime or burnt lime at  $600^\circ$  (13) or  $\text{BaCl}_2$  at  $300\text{--}500^\circ$  at 20–50 mm. (14) yields 2-methylbutadiene-1,3 (isoprene) (1:8020).]

$\tilde{\text{C}}$  on boilg. with aq. or with aq.  $\text{Na}_2\text{HPO}_4$  for 30 hrs. gave (2) only 10% hydrolysis;  $\tilde{\text{C}}$  on boilg. with 1 mole  $\text{NaOH}$  in aq. soln. for 24 hrs. gave (2) only 17% hydrolysis, accompanied by isopropyl methyl ketone (1:5410).

$\tilde{\text{C}}$  on boilg. with 35 pts. aq. for 40 hrs. gave (5) complete decomposition with formn. of isopropyl methyl ketone (2-methylbutanone-3) (1:5410) q.v., b.p.  $94^\circ$ .

B.P.  $137.8^\circ$  at 734.5 mm. (1)

$D_4^{25} = 1.074$  (1)  $n_D^{18} = 1.4132$  (2)

$137.6^\circ$  at 730 mm. (2)

$142^\circ$  (3)

$n_D^{25} = 1.417$  (1)

$37\text{--}38^\circ$  at 13 mm. (2)

Colorless mobile lachrymatory liq. with sharp but pleasant odor. — Insol. aq. and only slowly hydrolyzed by it even on htg. (1).

[For prepn. (35% yield (3)) from *n*-butyl alc. (1:6180) + phosgene (3:5000) see (1) (3); from di-*n*-butyl carbonate (1:3626) +  $\text{PCl}_5$  see (2).]

$\tilde{\text{C}}$  on htg. with quinoline dec. at  $81^\circ$  (4) into *n*-butyl chloride (3:7160) +  $\text{CO}_2$ .

Ⓐ *n*-Butyl carbamate: from  $\tilde{\text{C}}$  by shaking with conc. aq.  $\text{NH}_4\text{OH}$  (1); pr. from alc., m.p.  $54^\circ$  (1).

Ⓑ *n*-Butyl-*N*-phenylcarbamate (*n*-butyl carbanilate): from  $\tilde{\text{C}}$  in ether by treatment with ether soln. of aniline (1 mole) + pyridine (1 mole) (1); pr., m.p.  $65.5^\circ$  (1),  $61^\circ$  (5). [For corresp. products from many other substituted anilines see (1).]

Ⓒ *n*-Butyl phenylcarbazate: from  $\tilde{\text{C}}$  (3.9 g.) + phenylhydrazine (3.1 g.) + pyridine (3.1 g.) in aq. (15 ml.); after solidification of the sepg. yel. oil it is washed with aq. and recryst. from  $\text{C}_6\text{H}_6$ : white scaly cryst., m.p.  $70^\circ$  (6).

3,5,6-trichloro-2-methylbenzoquinone-1,4 [Beil. VII-651, VII-1-(354)], m.p. 238° (2); from 2,4-dichloro-3-methylphenol (3:1205), from 2,6-dichloro-3-methylphenol (3:0150), and from 4,6-dichloro-3-methylphenol (3:1745) in  $\text{CHCl}_3$  with  $\text{Cl}_2$  see (1).]

[ $\bar{\text{C}}$  with  $\text{PCl}_5$  yields (2) both *tris*-(2,4,6-trichloro-3-methylphenyl) phosphate, m.p. 230° (2), and *bis*-(2,4,6-trichloro-3-methylphenyl) phosphate, m.p. 94.5° (2); for study of Hg, Sb, and Bi derivs. of  $\bar{\text{C}}$  see (2).]

[ $\bar{\text{C}}$  on sulfonation with fuming  $\text{H}_2\text{SO}_4$  (50%  $\text{SO}_3$ ) at 50° yields (4) a monosulfonic acid; for condens. of  $\bar{\text{C}}$  with benzaldehyde-*p*-sulfonic acid and use of prod. as mothproofing agent see (5); for study of use of Na or K salts of  $\bar{\text{C}}$  as wood impregnants (preservatives) see (6).]

$\bar{\text{C}}$  with aqua regia at 100° for 1½ hrs. gives (25% yield (3)) 3,5,6-trichloro-2-methylbenzoquinone-1,4 (see above), m.p. 233° (3).

[ $\bar{\text{C}}$  in aq. alk. with  $\text{Me}_2\text{SO}_4$  yields (2) corresp. methyl ether, ndls. from alc., m.p. 46°, b.p. 258° (2);  $\bar{\text{C}}$  in aq. alk. with  $\text{Et}_2\text{SO}_4$  yields (2) corresp. ethyl ether, ndls. from alc., m.p. 35.5°, b.p. 266° (2) ]

— 2,4,6-Trichloro-3-methylphenyl acetate: m.p. 35°, b.p. 270° (2).

① 2,4,6-Trichloro-3-methylphenyl benzoate: fine prismatic pl. from alc., m.p. 53° (1). [From  $\bar{\text{C}}$  with  $\text{BzCl}$  in pyridine (1).]

② 2,4,6-Trichloro-3-methylphenyl benzenesulfonate: prismatic pl. from alc., m.p. 121° (1). [From  $\bar{\text{C}}$  with benzenesulfonyl chloride in pyridine (1).]

③ 2,4,6-Trichloro-3-methylphenyl *p*-toluenesulfonate: prismatic pl. from alc., m.p. 92-93° (1). [From  $\bar{\text{C}}$  with *p*-toluenesulfonyl chloride in pyridine (1).]

### 3:0625 2,3,6-TRICHLOROTOLUENE

$\text{C}_7\text{H}_5\text{Cl}_3$

Beil. V - 299

V<sub>1</sub>—  
V<sub>2</sub>—

M.P. 45-46° (1)

41-42° (2)

White ndls. from alc.

[For prepn. of  $\bar{\text{C}}$  from 2,6-dichloro-3-aminotoluene [Beil. XII-872] via diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reactn. see (1); from *p*-toluenesulfonyl chloride via chlorination, hydrolysis to acid, and subsequent hydrolytic cleavage of the sulfonic acid radical see (3) (2); for formn. of  $\bar{\text{C}}$  together with other prods. from 2,5-dichlorotoluene (3:6245) or 2,6-dichlorotoluene (3:6270) with  $\text{Cl}_2$  in pres. of  $\text{Al/Hg}$  see (4) ]

[ $\bar{\text{C}}$  with  $\text{Cl}_2$  in pres. of  $\text{Al/Hg}$  yields (5) 2,3,5,6-tetrachlorotoluene (3:2575).]

$\bar{\text{C}}$  on mononitration by soln. in cold fuming  $\text{HNO}_3$  yields (1) 2,3,6-trichloro-5-nitrotoluene [Beil. V-333], ndls. from alc., m.p. 57-58° (1);  $\bar{\text{C}}$  on dinitration, e.g., with 6 pts. fuming  $\text{HNO}_3$  + 4 pts. conc.  $\text{H}_2\text{SO}_4$  (1), yields 2,3,6-trichloro-1,5-dinitrotoluene [Beil. V-346], pr. from  $\text{AcOH}$ , m.p. 140-142° (1), 140-141° (6).

$\bar{\text{C}}$  on oxidn. with dil.  $\text{HNO}_3$  in s.t. at 140° yields (1) 2,3,6-trichlorobenzoic acid (3:4500), m.p. 164°.

[ $\tilde{C}$  on htg. with sodium diethylacetate yields (2) corresp. anhydride, b.p. 230° (2).]

[ $\tilde{C}$  with  $Cl_2$  yields (4)  $\alpha$ -chloro-diethylacetyl chloride, b.p. 93° at 70 mm. (amide, m.p. 58° (4));  $\tilde{C}$  with  $Br_2$  yields (5)  $\alpha$ -bromo-diethylacetyl bromide, b.p. 98–100° at 25 mm. (5); for reactn. of  $\tilde{C}$  with  $AlCl_3 + C_6H_6$  see (6).]

[ $\tilde{C}$  (1 mole) upon addition to *ter*-butyl  $MgCl$  (3.7 moles) in dry ether yields (3) (by virtue of reducing actn. of the tertiary  $RMgX$  cpd.) 2-ethylbutanol-1 (1:6223), 2,2-dimethyl-4-ethylhexanol-3 (b.p. 131–132° at 150 mm.,  $D_4^{20} = 0.8339$ ,  $n_D^{20} = 1.4340$ –1.4362,  $N$ -( $\alpha$ -naphthyl)carbamate, m.p. 63–64°, and hexamethylethane (1:7090), m.p. 103° (3).]

$\tilde{C}$  on hydrolysis yields 2-ethylbutanoic acid (1:1115) q.v. (for the amide, anilide, *p*-toluidide, and other derivatives corresponding to  $\tilde{C}$  see 1:1115).

## CHAPTER XVIII

### DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

#### Section 2. $D_4^{20}$ less than 1.1500

(3:8000-3:8499)

3:8000	3-CHLOROBUTANOL-2 ( <i>β</i> -Butylene chlorohydrin; pseudo-butylene chlorohydrin)	$\begin{array}{c} \text{CH}_3-\text{CH}-\text{CH}-\text{CH}_3 \\   \quad   \\ \text{Cl} \quad \text{OH} \end{array}$	$\text{C}_4\text{H}_9\text{OCl}$		Beil. I - 373 I <sub>1</sub> - I <sub>2</sub> -(403)
--------	---	--	----------------------------------	--	--

B.P. 138-140°	(1)	$D_0^{18} = 1.0692$ (3) (4)	$n_D^{20} = 1.4422$ (9)
138-139° at 763 mm.	(2)		
136.0-137.5° at 760 mm.	(3) (4)		
134-138°	(9)		
76-79° at 100 mm.	(5)		

[See also *d,l*-erythro-3-chlorobutanol-2 (3:8004) and *d,l*-threo-3-chlorobutanol-2 (3:8002).]

$\bar{C}$  in this present discussion designates the ordinary mixture of stereoisomeric configurations of 3-chlorobutanol-2.

Colorless somewhat viscous liq. of agreeable odor. —  $\bar{C}$  is sol. at 20° in 15 vols. aq (2); its sepn. from dilute aq. solns. is best effected by steam distillation at reduced pressure (6) cf. (9).

[For prepn. of  $\bar{C}$  from ordinary butene-2 (mixt. of *cis* and *trans* stereoisomers) by addn. of HOCl (yields: 55% (11), 50% (3), 20% (5)) (4) (1) (2), with  $\text{Cl}_2$  + steam at 100° (60-65%  $\bar{C}$  together with 10-30% 2,3-dichlorobutane (3:7615) (6)), with  $\text{Cl}_2$  + aq. at 40-50° (50-60% yield (6)) (9), or with *N*-chlorourea in dil aq acid 15-17° in pres. of  $\text{CuCl}_2$  (best yield 79.9%  $\bar{C}$  + 20.1% 2,3-dichlorobutane (3:7615) obtd. in 5% AcOH (7), but proportion of the two products varies widely with nature of acid used) see indic. refs.]

[For tabular and graphic data on equilibrium consts. of binary system  $\bar{C}$  + aq., and ternary system  $\bar{C}$  + 2,3-dichlorobutane (3:7615) + aq. see (8).]

$\bar{C}$  in s.t. at 180°, or  $\bar{C}$  with aq. in a.t. at 100° for 10 hrs. or at 120° for 3 hrs., gives (80-100% yield (3)) (10) butanone-2 (ethyl methyl ketone) (1:5405) + HCl (cf. also (14)).

[ $\bar{C}$  with solid KOH (5), or with 40-50% aq. NaOH or KOH (15-20% excess) at 75-90° (11) (10), or with aq. KOH,  $\text{K}_2\text{CO}_3$ , or PbO at ord temp. (3) (4) (2) causes elimination of HCl and gives (yields: 87-90% (11), 75-81% (10), 66% (5)) 2,3-epoxybutane ( $\alpha,\beta$ -dimethylbutylene oxide) (1:6116) (mixt. of *cis* and *trans* stereoisomers) ]

[The simple alkyl ethers of  $\bar{C}$  have been prepared by indirect means; e.g., from butene-2 by action of corresp. alkyl hypochlorites dislvd. in the corresp. alc. or by action of *N,N'*-(3-chloro-2-methoxybutane), b.p. 116°, chloro-2-ethoxybutane, b.p. 122-124°, isopropyl, and isomethyl ethers see (12).]

- 3-Chlorobutyl-2 acetate: b.p. 161-165° at 760 mm., 71-73° at 30 mm.,  $D_4^{20} = 1.0692$ ,  $n_D^{20} = 1.4298$  (13) cf. (7). [Prepd. indirectly from ord. butene-2 with *N,N*-dichlorobenzenesulfonamide + AcOH in ether (28% yield (13)).] [For analogous prepn. of the corresp. formate, chloroacetate, and trichloroacetate see (13).]
- 3-Chlorobutyl-2 benzoate: b.p. 263-265.5 u.c. (7).
- 3-Chlorobutyl-2 *p*-nitrobenzoate: unreported.
- 3-Chlorobutyl-2,3,5-dinitrobenzoate: unreported.

3: 8030 *d,l*-3-CHLORO-2-METHYLBUTANOL-2  $C_4H_9Cl$  Beil. I - 390  
(Trimethylethylene chlorohydrin;  $I_1$ —  
3-chloro-*ter*-amyl alcohol;  $I_2$ -(424)  
 $\alpha$ -chloroethyl-dimethyl-carhinol)

B.P. 141–143° (1)  $D_{25}^{22} = 1.0355$  (2)  
141° (2) (3) (4)  
139–141° (5)  $D_0^0 = 1.0562$  (2)  
43–45° at 15 mm. (5) 1.0546 (1)

Liq. sol. in 15–16 pts. aq. at room temp. (1).

[For prepn. of  $\bar{C}$  from 2-methylbutene-2 (trimethylethylene) (1:8220) with HOCl (50% yield (1) (2)) or with *N*-chlorourea in acid solution (70% yield (5)) see indic. refs.; for prepn. of  $\bar{C}$  from 3-chloropentanone-2 ( $\alpha$ -chloroethyl methyl ketone) (3:7893) (3) (4) or from ethyl  $\alpha$ -chloropropionate (3:8125) (6) with MeMgBr (3) or MeMgI (4) see indic. refs.; note that a mixture of  $\bar{C}$  with 2-chloro-2-methylbutanol-3 (3:9200) results from 2,3-epoxy-2-methylbutane (trimethylethylene oxide) [Beil. XVII-13], b.p. 75°, by ring cleavage with HCl (4).]

$\bar{C}$  on distillation over  $P_2O_5$  (1) or on htg. at 130° with anhydrous oxalic acid (1:0535) (5) or with  $H_2SO_4$  (92% yield (7)) gives 3-chloro-2-methylbutene-2 (trimethylvinyl chloride) (3:7335), b.p. 97–98°, + 1-chloro-2-methylbutene-2 ( $\beta,\gamma$ -dimethylallyl chloride) (3:7485), b.p. 110°.

$\bar{C}$  on hoilg. with aq. +  $BaCO_3$  yields (5) 2-methylbutanediol-2,3 (trimethylethylene glycol) [Beil. I-482,  $I_1$ -(251),  $I_2$ -(549)];  $\bar{C}$  on htg. with KOH (3) (6), alc. KOH (40% yield (5)), or better powdered KOH in ether (70% yield (5)) gives 2,3-epoxy-2-methylbutane (see above).

$\bar{C}$  on htg. in a s.t. with aq. at 140° (8) or by itself at 155° (8), or on htg. with aniline (70% yield (5)), gives 2-methylbutanone-3 (isopropyl methyl ketone) (1:5410).

$\bar{C}$  with MeMgI as directed (9) yields 2,3-dimethylbutanol-2 (dimethyl-isopropyl-carhinol) (1:6187).

## 3:8032 1-CHLOROHEPTYNE-1

 $C_7H_{11}Cl$ 

Beil. S.N. 12

B.P. 141-142°	at 760 mm. (1)	$D_4^{24} = 0.9250$ (3)	$n_D^{24} = 1.4411$ (3)
65°	at 49 mm. (2)		
65°	at 45 mm. (3)	$D_4^{18} = 0.918$ (1) (5)	$n_D^{18} = 1.441$ (1) (5)
58.0-58.4°	at 35 mm. (4)		

[For prepn. of  $\bar{C}$  from heptyne-1 (*n*-amylacetylene) (1:8085) via conversion with  $NaNH_2$  in ether (1) or in liq.  $NH_3$  (4) to  $C_6H_{11}C \equiv CNa$  and subsequent reactn. with benzenesulfonyl chloride (yield: 52% (5), 60% (1)) or *p*-toluenesulfonyl chloride (yield: 60-65% (1) (5)) see indic. refs.; via conversion with  $KNH_2$  in liq.  $NH_3$  (3) to  $C_6H_{11}C \equiv CK$  and subsequent treatment with  $Cl_2$  in dry ether at  $-70^\circ$  see (3).]

Refractive indices of  $\bar{C}$  on Pulfrich instrument:  $n_D^{12.9} = 1.4402$ ;  $n_D^{19} = 1.4429$ ;  $n_F^{12.9} = 1.4492$ ;  $n_D^{19} = 1.4540$  (1).

$\bar{C}$  with  $HgSO_4/H_2SO_4$  gives (24-28% yield (1)) 1-chloroheptanone-2, b.p. 72-75° at 20 mm.,  $D_4^{20} = 0.802$ ,  $n_D^{20} = 1.450$  (1) (see, however, different values below).

$\bar{C}$  refluxed 6 hrs. with alc.  $NaOEt$  gives (74% yield (1)) *n*-heptanoic acid (1:1140).

$\bar{C}$  with  $HgO.BF_3$  cat. in  $MeOH$  gives (30% yield (2)) 1-chloro-2,2-dimethoxyheptane, b.p. 80-82° at 8 mm.,  $D_4^{25} = 0.9842$ ,  $n_D^{25} = 1.4325$  (2); this on hydrolysis with 15%  $HCl$  yields (2) 1-chloroheptanone-2, b.p. 80-82° at 13 mm.,  $D_4^{26} = 0.9896$ ,  $n_D^{26} = 1.4387$  (2) (cf. values given above for prepn. by different method.)

$\bar{C}$  with  $KCN$  in aq.  $MeOH$  gives (43% yield (2)) 1-cyano-2-methoxyheptene-1, b.p. 124-131° at 15 mm.,  $D_4^{25} = 0.9205$ ,  $n_D^{25} = 1.4462$  (2) (prob. a mixt. of geom. stereoisomers.)

$\bar{C}$  fails to react with  $KI$ ; after bting. 4 hrs. with 10 pts.  $N$   $KI$   $\bar{C}$  was recovered unchanged (1).

3:8035 *d,l*-β-METHYL-*n*-VALERYL CHLORIDE $C_8H_{11}OCl$ 

Beil. S.N. 162

(sec.-Butyl-acetyl chloride)

B.P. 142.5-143.0°	at 749 mm. (1)	$D_4^{20} = 0.9781$ (1)
142-144°	(2)	
140°	at 738 mm. (3)	$D_4^{21} = 0.9963$ (1)

[For prepn. of  $\bar{C}$  from 3-methylpentanoic acid (1:1125) with  $SOCl_2$  see (1) (2) (3).]

$\bar{C}$  with  $AlCl_3 + C_6H_6$  in  $CS_2$  gives (3) (sec.-butyl-acetyl)benzene (β-methyl-*n*-valerophenone, b.p. 160-161° at 50 mm. (semicarbazone, m.p. 179-180°);  $\bar{C}$  with diethyl-zinc yields (2) 3-methylheptanone-5, b.p. 156.5-157.5°,  $D_4^{15} = 0.825$ ,  $n_D^{15} = 1.4159$  (semicarbazone, m.p. 101-102°).]

$\bar{C}$  on hydrolysis yields 3-methylpentanoic acid (1:1125) q.v. (for the amide, anilide, *p*-toluidide, and other derivatives corresponding to  $\bar{C}$  see 1:1125).

Colorless liq. with somewhat penetrating but not disagreeable odor. — Volatile with steam. — Stable when pure and dry; in presence of moisture and traces of HCl, however, turns yellow, then brown (1).

[For prepn. of  $\bar{C}$  from cyclohexanol (1:6415) + conc. HCl under various conditions (yield: 93% (12), 00% (7), 85% (3), 60-70% (0)) see (1) (10) (7) (3) (0); from cyclohexane by chlorination with Cl<sub>2</sub> (11) (1) (6) (18) (33) or with SO<sub>2</sub>Cl<sub>2</sub> (5) (13) see indic. refs.; from cyclohexene (1:8070) with *ter*-BuCl (3:7045) in liq. HF at 0-5° (65% yield) see (34).]

$\bar{C}$  on treatment with alc. KOH (14) (6) (8), or on passing over dehydrohalogenating catalysts such as CaO, BaCl<sub>2</sub>, etc., at elevated temps. (16) (16) (17) (10), or even somewhat on distillation (7), loses HCl to give cyclohexene (1:8070), b.p. 83°.

[For study of behavior of  $\bar{C}$  with AlCl<sub>3</sub> in CS<sub>2</sub> or cyclohexane see (20); for reactn. of  $\bar{C}$  with C<sub>6</sub>H<sub>6</sub> + AlCl<sub>3</sub> to give 60-78% yield of phenylcyclohexane (1:7595), b.p. 233.7°, see (9) (21); for reactn. of  $\bar{C}$  with NaOC<sub>6</sub>H<sub>11</sub> to yield dicyclohexyl ether, b.p. 124-126° at 10 mm., see (22); for study of reactivity of  $\bar{C}$  with KI (23) (24), NaOMe, pyridine, or piperidine (24) see (23) (24); for reactn. of  $\bar{C}$  with oxalyl chloride (3:5060) giving (60% yield (31)) hexahydrobenzoyl chloride (3:8580), b.p. 180-181° u.c., see (31).]

$\bar{C}$  with Mg in dry ether gives under optimum conditions 96.5% yield (25) RMgCl; this on oxidn. with O<sub>2</sub> at 25° gives (81% yield (26)) cyclohexanol (1:6145) q.v., accompanied by small amts. of dicyclohexyl ether and dicyclohexyl (1:8490). [Note that  $\bar{C}$  on reactn. with Ag 3,5-dinitrobenzoate does not (27) yield expected cyclohexyl 3,5-dinitrobenzoate, m.p. 112-113°.]

① Cyclohexanecarboxylic acid (hexahydrobenzoic acid) (1:0575): m.p. 30-31°, b.p. 233°, Neut. Eq. 128. [From RMgCl on treatment with CO<sub>2</sub> and subsequent acidification (85% yield (25) (28)).]

② Cyclohexanecarboxylic acid anilide (hexahydrobenzanilide): m.p. 146° cor. (29), 143-144° u.c. (30). [From RMgCl (30) (or RMgBr (29)) by reactn. with phenyl isocyanate.]

③ Cyclohexanecarboxylic acid *p*-toluidide (hexahydrobenzo-*p*-toluidide): unrecorded.

④ Cyclohexanecarboxylic acid  $\alpha$ -naphthalide (hexahydrobenzo- $\alpha$ -naphthalide): m.p. 183° u.c. (32). [From R.MgBr +  $\alpha$ -naphthyl isocyanate (32).]

### 3: 8045 *d,l*-3,4-DICHLOROPENTENE-2

B.P. 142-144° at 736 mm. (1)

Two geom. stereoisomers of  $\bar{C}$  are possible, but as yet only this one is recognized.

[For prepn. of  $\bar{C}$  from 3-chloropenten-2-ol-4 with  $\text{PCl}_3$  see (1).]

$\bar{C}$  on boilg. with aq. is partially reconverted (1) to 3-chloropenten-2-ol-4 [Beil. I-443], b.p. 158-159° at 724.4 mm

$\bar{C}$  adds  $\text{Br}_2$  yielding (1) 2,3-dibromo-3,4-dichloropentane, b.p. 140-145° at 31 mm. (1).

3: 8045 (1) Garzarolli-Thurnlackh, *Ann.* 223, 160-161 (1884).

### 3: 8050 *d,l*-4-CHLOROHEPTENE-2 (Propenyl-*n*-propyl-carbinyl chloride)

B.P. 140-145° (1)

140-144° (5)

86-90° at 104 mm. (5)

49° at 21 mm. (2)

46-48° at 12 mm. (3)

$n_D^{21} = 1.4430$  (2)

$n_D^{19} = 1.4422$  (3)

$D_4^{18} = 0.879$  (2)

Note that some evidence exists (1) that in certain reactions  $\bar{C}$  reacts (by virtue of allyl transposition) as its synionic isomer 2-chloroheptene-3 (but this has not itself been characterized).

[For prepn. from hepten-2-ol-4 (propenyl-*n*-propyl-carbinol) [Beil. I-447, I<sub>2</sub>(488)]

$\bar{C}$  with  $Br_2$  followed by abs. alc. gives (94% yield (6)) ethyl  $\alpha$ -bromo-isobutylacetate, b.p. 100–102° nt 17 mm. (6); for study of catalytic reduction of  $\bar{C}$  see (7).]

$\bar{C}$  on hydrolysis yields isobutylacetic acid (isocaproic acid) (1:1127) q.v. (for the amide, anilide, *p*-toluidide, and other derivatives corresponding to  $\bar{C}$  see 1:1127).

### 3:8095 *d,l*-4-CHLOROHEPTANE

(Di-*n*-propyl-carbinyl chloride)

B.P. 144–145° at 758 mm. (1)

$D_4^{20} = 0.8710$  (3)  $n_D^{20} = 1.4237$  (1)

143.1–144.4° at 751 mm. (2)

0.8619 (1) 1.4231 (3)

48.9° at 21 mm. (3)

$D_4^{15} = 0.8751$  (3) 1.4199 (2)

[For prepn. of  $\bar{C}$  from heptanol-4 (1:6228) with conc.  $HCl + ZnCl_2$  (1) (2) (3) (yield: 60–64% (3), 35% (1)) see indic. refs.]

$\bar{C}$  converted to corresp. acetate by 7-hr. reflux with  $KOAc + AcOH$ , then hydrolyzed by 6-hr. boilg. with 20% alc.  $KOH$ , and the resultant heptanol-4 (1:6228) oxidized with  $CrO_3/H_2SO_4$  gives (3) heptanone-4 (1:5447) q.v. (semicarbazone, m.p. 129° by this route, 132° from authentic heptanone-4 (3)).

$\bar{C}$  with powdered or alc.  $KOH$  or  $NaOH$  slowly regenerates heptanol-4 (1:6228) without any trace of olefin (1).

3:8095 (1) Mathus, Gibon, *Bull. soc. chim. Belg.* **34**, 306 (1925). (2) Dillon, Lucas, *J. Am. Chem. Soc.* **50**, 1711–1714 (1928). (3) Sherrill, *J. Am. Chem. Soc.* **52**, 1985–1989 (1930).

### 3:8100 *d,l*-2-CHLORO-2-METHYLHEPTANE

(*n*-Amyl-dimethyl-carbinyl chloride)

B.P. 140–150° dec. (1)

$D_4^{25} = 0.8568$  (2)  $n_D^{25} = 1.4363$  (4)

49.5–51° at 15 mm. (2)

$n_D^{20} = 1.4263$  (4)

1.4257 (3)

1.4250 (2)

$\bar{C}$  decomposes very easily on distn. (cf. (3)).

[For prepn. of  $\bar{C}$  from 2-methylheptanol-2 (*n*-amyl-dimethyl-carbinol) [Beil. I-420, I<sub>1</sub>-(209), I<sub>2</sub>-(452) (2) (3)] with  $HCl$  gas (yield 81% (2), 73% (3)) or with  $AcCl$  (1) see indic. refs.]

$\bar{C}$  on distn. over powdered  $KOH$  gives 2-methylheptene-2 ( $\alpha,\alpha$ -dimethyl- $\beta$ -*n*-butyl-ethylene) [Beil. I-222, I<sub>1</sub>-(93)], b.p. 122–123° nt 755 mm.,  $D_4^{20} = 0.816$  (1).

$\bar{C}$  with  $Mg$  in dry ether as directed (2) gives 59.9% yield  $RMgCl$ .

$\bar{C}$  on conversion to  $RMgCl$  and subsequent treatment with  $CO_2$  gives (in addition to much olefin) (22% yield (2)) dimethyl-*n*-amyl-acetic acid, b.p. 118°,  $n_D^{20} = 1.4335$ –1.4305 (2) (amide, m.p. 102.5–103.5° (2)).

$\bar{C}$  is scarcely attacked by  $K_2CO_3$  (1) —  $\bar{C}$  on boilg. with aq. for 100 hrs. can be recovered unchanged to extent of 85%, the remainder yielding traces of 2-methylbutanediol-1,2 [Beil. I-482], 2-methylbutanone-3 (isopropyl methyl ketone) (1:5410), and 2-methyl butyne-1 (isopropylacetylene) (1:8010) (3).

$\bar{C}$  passed over soda-lime at  $470^\circ$  gives (2) 2-methylbutadiene-1,3 (isoprene) (1:8020).

3:8075 (1) Kondakow, *J. Russ. Phys.-Chem. Soc.* 20, 144 (1888). (2) Perkin, *J. Soc. Chem. Ind.* 31, 616-624 (1912). (3) Froebe, *Hochstetter, Monatsch.* 23, 1079-1081 (1902). (4) Badische Anilin- u. Soda-Fabrik, Ger. 261,677, March 14, 1911; *Cent.* 1913, II 325.

### 3:8080 *d,l*-3-CHLOROHEPTANE

(Ethyl-*n*-butyl-carbinyl chloride)

$C_7H_{15}Cl$

Beil. I —

NaOEt (90% yield) see (4); from paraldehyde (1:0170) by chlorination and subsequent treatment with EtOH see (5) (6); from EtOH (1:6130) by treatment with  $Cl_2$  see (7) (8).]

[For prepn. of  $\bar{C}$  from chloroacetaldehyde (3:7212) on warming with EtOH see (9); from chloroacetaldehyde ethyl alcoholate (chloroacetaldehyde ethyl-hemi-acetal) [Beil. I-611] in EtOH with dry HCl gas see (10); from  $\alpha,\beta$ -dichloroethyl ethyl ether (3:5640) with 2 vols. abs. EtOH (2) or with NaOEt (11) (12) (13) see indic. refs.]

$\bar{C}$  is comm. chem. in U.S. (1943) (14);  $\bar{C}$  is widely used in org. synthesis as source of combined chloroacetaldehyde (3:7212) and otherwise.

The acetal portion of  $\bar{C}$  is stable to alkali but readily hydrolyzed by aq. acids; the chlorine atom, however, behaves like a reactive alkyl halide; all these characteristics are illustrated in the reactns. cited below.

$\bar{C}$  on warming with dil.  $H_2SO_4$  yields (15) chloroacetaldehyde (3:7212) accompanied by some *bis*-( $\beta$ -chloro- $\alpha$ -ethoxyethyl) ether, h.p. aht. 165°;  $\bar{C}$  on satn. at 100° with dry HCl gas yields (9)  $\alpha,\beta$ -dichloroethyl ethyl ether (3:5640). —  $\bar{C}$  on htg. with AcOH at 120° or with anhydrous oxalic acid at 100-150° yields (12) chloroacetaldehyde (3:7212) + ethyl acetate (1:3015) or diethyl oxalate (1:1055) respectively.

[ $\bar{C}$  htd. with NaOEt in s.t. at 140-150° for 30 hrs. (11) (13) (17) or with abs. alc. NaOEt at 160° under press. (16) gives (66% yield (16)) ethoxyacetaldehyde diethylacetal, b.p. 168° (11) (this prod. on htlg. with dil.  $H_2SO_4$  (17) (13) (16) hydrolyzes to EtOH (1:6130) + ethoxyacetaldehyde (1:0159), h.p. 105-106°). —  $\bar{C}$  htd. with 10% excess of satd. abs. alc. KOH in s.t. for 75 hrs. gives (95% yield (18)) glycolaldehyde diethylacetal (hydroxyacetaldehyde diethylacetal) (1:0191), b.p. 167°.] [For reactn. of  $\bar{C}$  with many other alcs. (19) (20) and phenols (21) in pres. of alk. see indic. refs.]

[ $\bar{C}$  htd. with Na or Mg at 120-130° (22) or with Na in ether at 0-20° (23) yields ethyl

[ $\bar{C}$  htd. with 4-5 vols. conc. aq.  $NH_4OH$  in s.t. at 130° for 12-14 hrs. (25) or  $\bar{C}$  in satd. alc.  $NH_3$  in s.t. at 130° (26) (27) (28) or refluxed in pres. of NaI (29) yields aminoacetaldehyde diethylacetal [Beil. IV-308, IV<sub>1</sub>-(449), IV<sub>2</sub>-(758)], b.p. 163°. —  $\bar{C}$  htd. with alc. hydrazine hydrate under press. for 6 hrs. at 115-120° yields (30) hydrazinoacetaldehyde diethylacetal [Beil. IV-553].]

[ $\bar{C}$  with aniline +  $NaNH_2$  in ether gives (77% yield (31)) *N*-(phenyl)aminoacetalde-

hyde diethylacetal [Beil. XII-213], b.p. 92-94° at 0.3 mm.; for corresp. behavior with benzylamine (32) or primary alph. amines (33) see indic. refs.] —  $\bar{C}$  with 3 moles phenylhydrazine htd. several hrs. at 130° yields (34) glyoxal-bis-(phenylhydrazone), yel. tbls. from alc. or ether, m.p. 177° u.e., 179° cor. (34).

$\bar{C}$  on acid hydrolysis (3) yields ethyl alcohol (1:6130) and chloroacetaldehyde (3:7212) q.v.

TbIs. from  $CHCl_3$  + lgr. (3) (4); cryst. from pct. eth. (5). — [For crystallog. data see (5) (8).]

[For prepn. (93% yield (9)) from *o*-chlorobenzoyl chloride (3:0640) +  $C_6H_6$  +  $AlCl_3$  see (3) (5) (9); for formation (12%) in reaction of  $BzOH$  + chlorobenzene +  $AlCl_3$  (main prod. 4-chlorobenzophenone (3:1914)) see (2) ]

$\bar{C}$  on reduction with 10%  $Na/Hg$  + alc. (11) or boilg. alc.  $KOH$  (12) gives almost exclusively 2-chlorodiphenylcarbinol [Beil. VI-680], m.p. 65° (11) (12), 62° (19). —  $\bar{C}$  with  $Al/Hg$  + 80% alc. (6) gives mainly 2-chlorodiphenylcarbinol (above) + a little 2,2'-dichlorobenzpinacol. —  $\bar{C}$  with  $Zn$  +  $AcOH$  (11) or  $\bar{C}$  in alc. on long exposure to sunlight (11) (13) (14) gives 2,2'-dichlorobenzpinacol [Beil. VI-523], m.p. 174-175° (6), 178° dec. (11).

$\bar{C}$  htd. with aniline 3-4 hrs. at 200° yields (4) 2-chlorobenzophenone anil [Beil. XII-201], pale yel. ndls. or scales from alc., m.p. 128° (4). [Fused subst. or solns. in org. solvents (especially  $CHCl_3$ ) are yellow.]

$\bar{C}$  fused for 3 hrs. at 200° with a mixt. of  $KOH$  +  $NaOH$  gives (1)  $BzOH$  (1:0715) (90-95% yield) + chlorobenzene (3:7903) but no *o*-chlorobenzoic acid; however,  $\bar{C}$  with aq.  $NaOH$  + trace  $CaO$  in iron bomb (or in pres. of  $Fe$  powder) at 240° for 6 hrs. gives (58% yield (20)) fluorenone (1:0014).

$\bar{C}$  with  $CH_3MgI$  yields (15) 1-(*o*-chlorophenyl)-1-phenylethylene, oil, b.p. 162-163° at 18 mm. (15);  $\bar{C}$  with  $Mg$  +  $MgI_2$  easily loses nuclear halogen (16).

⑤ 2-Chlorobenzophenone oxime: from  $\bar{C}$  +  $NH_2OH \cdot HCl$  + dil. alc.  $KOH$  (5) (17) (7) or from  $\bar{C}$  +  $NH_2OH \cdot HCl$  + alc. htd. in s.t. for 3 hrs. at 130° (17); cryst. from pct. ether, m.p. 133-134° (17), 121° (5) (7). [With  $PCl_5$  in dry ether, followed by aq. this oxime yields by Beckmann rearr. *o*-chlorobenzanilide [Beil. XII-266], m.p. 118° (5), 114° (17).] [The above oxime boiled with cone. aq.  $KOH$  for 1 day (5) or refluxed 6 hrs. with 20 pts. 30%  $MeOH/KOH$ , then diluted with aq. (17) (18), gives 3-phenylindoxazene [Beil. XXVII-71], ndls. or tbIs. from ether or alc., m.p. 83-84° (18), 82.5° (5) (11).]

accompanying *p*-isomer (3:8287) varies widely, e.g., from 100%  $\bar{C}$  with  $\text{PhCl}_2 + \text{NH}_4\text{OH}$  (42), through 62% *o*/28% *p* with  $\text{PbCl}_2$  (8), to 2.5 *o*/1 *p* via the electrolytic methods (40) (for details the orig. refs. must be consulted).] — [For sepn. of  $\bar{C}$  from polychlorotoluenes via const.-boilg. mixt. with aq. see (79).]

[For prepn. of  $\bar{C}$  from hydrazone of *o*-chlorobenzaldehyde (3:6410) by Wolff-Kishner reduction (35–82% yield) see (113).]

[For thermal anal. of system:  $\bar{C} + \text{SbCl}_3$  see (48).]

[ $\bar{C}$  with  $\text{H}_2$  in pres. of  $\text{Pd}/\text{CaCO}_3$  in alc./alk. soln. loses all its chlorine as  $\text{HCl}$  (49);  $\bar{C}$  with  $\text{HI} + \text{P}$  at  $302^\circ$  for 5 hrs. gives 80% yield (50) toluene (1:7405).]

$\bar{C}$  on oxidn. with  $\text{CrO}_3$  is completely destroyed (30);  $\bar{C}$  on oxidn. with boilg. aq.  $\text{KMnO}_4$  (74–78% yield (51)) (52) (36) (53) or  $\bar{C}$  on cat. oxidn. with air over granular tin vanadate at  $287^\circ$  (13.8% yield (54)) cf. (55) or  $\bar{C} + \text{KCN} + \text{NiCl}_2$  in dil. alc. 20 hrs. at  $260\text{--}270^\circ$  (7.5% yield (63)) gives *o*-chlorobenzoic acid (3:4150);  $\bar{C}$  with  $\text{CrO}_2\text{Cl}_2$  followed by aq. (51.5% yield (56)) (57) or  $\bar{C}$  on oxidn. with Ce cpds. (58) or with air over  $\text{Ta}_2\text{O}_5$  (59) cf. (60) or  $\bar{C}$  with  $\text{MnO}_2 + \text{H}_2\text{SO}_4$  (61) or  $\text{PhO}_2 + \text{dil. H}_2\text{SO}_4$  (24% yield (62)) gives *o*-chlorobenzaldehyde (3:6410).

[ $\bar{C}$  with  $\text{Cl}_2$  in pres. of  $\text{Al}/\text{Hg}$  gives (64) a mixt. contg. 2,3- (3:6345), 2,4- (3:6290), 2,6- (3:6270), together with some 2,5-dichlorotoluene (3:6245). —  $\bar{C}$  with  $\text{Cl}_2 + 3\% \text{PCl}_5$  in light gives (65) (19) *o*-chlorobenzyl chloride (3:6400);  $\bar{C}$  with  $\text{Cl}_2 + \text{PCl}_5$  at  $150\text{--}180^\circ$  (66) (67) (68) cf. (70) gives *o*-chlorobenzal (di)chloride (3:6625);  $\bar{C}$  with  $\text{Cl}_2 + \text{PCl}_5$  (73) or with  $\text{Cl}_2$  at  $160\text{--}190^\circ$  (69) gives (64% yield (69)) (70) (71) *o*-chlorobenzotrichloride (3:6880).]

[ $\bar{C}$  with  $\text{Br}_2$  in pres. of  $\text{Al}/\text{Hg}$  in  $\text{CCl}_4$  gives (74) mainly 5-bromo-2-chlorotoluene [Beil. V-307,  $V_1$ -(165)], together with a smaller amt. of 4-bromo-2-chlorotoluene [Beil. V-307,  $V_1$ -(155)]; the former is also obtd. (75) from  $\bar{C} + \text{Br}_2 + \text{HNO}_3 + \text{H}_2\text{SO}_4$  in  $\text{AcOH}$ . —  $\bar{C}$  with  $\text{Br}_2$  (76) (77) yields *o*-chlorobenzyl bromide [Beil.  $V_1$ -(155)] (for studies of rate of side-chain bromination of  $\bar{C}$  see (78)).]

[ $\bar{C} + \text{I}_2 + \text{HNO}_3 + \text{H}_2\text{SO}_4$  in  $\text{AcOH}$  gives (75) 2-chloro-5-iodotoluene [Beil. V-315]]

[ $\bar{C}$  with  $\text{AlCl}_3 + \text{HCl}$  gas as directed (7) undergoes partial rearr. to both *m*-chlorotoluene (3:8275) and *p*-chlorotoluene (3:8287); for anal. of mixts. of the three isomers see (7).]

[ $\bar{C}$  with  $\text{AcCl}$  (80) or better  $\text{Ac}_2\text{O}$  (81) +  $\text{AlCl}_3$  gives (70% yield (81)) 4-chloro-3-methylacetophenone [Beil. VII-307], b.p.  $254.2\text{--}254.4^\circ$  at 753.4 mm.,  $n_D^{25} = 1.5521$  (81). —  $\bar{C}$  with  $\beta$ -chloropropionyl chloride (3:5690) +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (68% yield (82)) (83) 2-chloro-5-( $\beta$ -chloropropionyl)toluene, colorless pr. from  $\text{C}_6\text{H}_6$ , m.p.  $46^\circ$  (82), which on ring closure with conc.  $\text{H}_2\text{SO}_4$  gives (82) (83) 6-chloro-7 (or 5)-methylindanone-1, cryst. from alc., m.p.  $74\text{--}75^\circ$  (82) (83). —  $\bar{C}$  with trichloroacetonitrile +  $\text{AlCl}_3$  (4 moles) at  $80\text{--}90^\circ$  satd. with  $\text{HCl}$  gas for 2 days gives (40% yield (84)) 4-chloro-3-methyl- $\alpha,\omega,\omega$ -trichloroacetophenone, b.p.  $155\text{--}160^\circ$  at 11 mm. (84). —  $\bar{C}$  with fumaryl (di)chloride +  $\text{AlCl}_3$  in  $\text{CS}_2$  at  $50\text{--}60^\circ$  for 2 hrs. gives (51% yield (85)) *trans*-bis-1,2-(4-chloro-3-methylbenzoyl)ethylene, pale yel. cryst. from alc., m.p.  $167^\circ$  (85).]

[ $\bar{C}$  with benzoyl chloride +  $\text{AlCl}_3$  gives (83% yield (86)) 3-chloro-4-methylbenzophenone [Beil. VII-(236)], lfts. from alc., m.p.  $82\text{--}83^\circ$  (86);  $\bar{C}$  with *o*-chlorobenzoyl chloride (3:6640) +  $\text{AlCl}_3$  in  $\text{CS}_2$  for 12 hrs. gives (87) 2',3'-dichloro-4-methylbenzophenone, cryst. from alc., m.p.  $43.5^\circ$  (87). —  $\bar{C}$  with naphthalene-bis-1,4 (or 5)-(dicarboxylic acid dichloride) +  $\text{AlCl}_3$  gives (88) bis-1,4 (or 5)-(chlorotoluoyn)naphthalene (used for ring closure to corresp. dihenzpyrenequinones).]

[ $\bar{C}$  with phthalic anhydride +  $\text{AlCl}_3$  at  $90^\circ$  gives (89) (90) (91) a mixt. (93% yield (90)) of two *o*-(chlorotoluoyn)benzoic acids A + B: A, m.p.  $183\text{--}184^\circ$  (90),  $182\text{--}183^\circ$  (91) (89), the main prod., is regarded variously as either (90) *o*-(3-chloro-4-methylbenzoyl)benzoic acid or (91) *o*-(4-chloro-3-methylbenzoyl)benzoic acid but in any case with conc.  $\text{H}_2\text{SO}_4$

ring-closes to give (92% yield (90)) (91) 2-chloro-3-methylanthraquinone, colorless tabs. from toluene, m.p.  $219^\circ$  (91) cor. (90); B, m.p.  $176-177^\circ$  (91), the minor prod., regarded (91) as *o*-(2-chloro-3-methylbenzoyl)benzoic acid, with conc.  $H_2SO_4$  ring-closes to give 1-chloro-2-methylanthraquinone, yel.-br. ndls. from toluene, m.p.  $171^\circ$  (91),  $170-171^\circ$  (90).] — [For reactn. of  $\bar{C}$  with 3,4-dichlorophthalic anhydride (3:3695) (92) or with pyromellitic anhydride (93) see indic. refs.]

[ $\bar{C}$  with aq. NaOH in pres. of Cu at  $350-360^\circ$  under press. yields (94) a mixt. contg. 41% *o*-cresol (1:1400) + 59% *m*-cresol (1:1730) (for extensive study of hydrolysis of  $\bar{C}$  as means of prepn. of *m*-cresol (1:1730) see (112));  $\bar{C}$  with  $NH_3$  + cat. under press. as directed (95) (96) (97) yields *o*-toluidine (for behavior of  $\bar{C}$  with liquid  $NH_3$  see (98)). —  $\bar{C}$  with aniline + Cu at  $175^\circ$  yields (99) phenyl-*o*-tolylamine. —  $\bar{C}$  with diphenylamine + K at  $240-245^\circ$  in  $H_2$  gives (by rearr.) (100) *N,N*-diphenyl-*m*-toluidine, m.p.  $69-70^\circ$ .] — [Note that  $\bar{C}$  does not react with aq. sodium sulfanilate +  $Na_2CO_3$  (dif. from benzyl chloride (3:8535)) and use in sepn. of  $\bar{C}$  from the latter (8)]

[ $\bar{C}$  on mononitration, e.g., with 4 pts.  $HNO_3$  ( $D = 1.52$ ) at  $0^\circ$  (101) gives a mixt. contg. all four possible isomers, viz., 43% 2-chloro-5-nitrotoluene [Beil. V-329,  $V_1$ -(163)], m.p.  $42.9^\circ$  (101),  $44^\circ$  (102), 21% 2-chloro-6-nitrotoluene [Beil. V-327,  $V_1$ -(162)], m.p.  $35.3^\circ$  (101),  $37^\circ$  (103) (104), 19% 2-chloro-3-nitrotoluene [Beil. V-328,  $V_1$ -(163)], m.p.  $22.1^\circ$  (101),  $21.5^\circ$  (105), and 17% 2-chloro-4-nitrotoluene [Beil. V-329,  $V_1$ -(163)], m.p.  $62.3^\circ$  (101),  $65^\circ$  (105A).]

$\bar{C}$  on dinitration, e.g., with mixt. of 3 wt. pts.  $HNO_3$  ( $D = 1.48$ ) + 9 wt. pts. conc.  $H_2SO_4$  at  $100^\circ$  (106), or with 2 vol. pts.  $HNO_3$  ( $D = 1.42$ ) + 5 vols. pts. conc.  $H_2SO_4$  at  $100^\circ$  as directed (107), gives mainly (55-60% (107)) 2-chloro-3,5-dinitrotoluene [Beil. V-345,  $V_1$ -(169)], cryst. from alc., m.p.  $64^\circ$  (107),  $63-64^\circ$  (106), accompanied by smaller amts. of three isomers, viz., 2-chloro-4,5-dinitrotoluene, m.p.  $83.5^\circ$  (18-20% (107)), 2-chloro-5,6-dinitrotoluene, m.p.  $106.5^\circ$  (18-20% (107)), and 2-chloro-4,6-dinitrotoluene, m.p.  $49^\circ$  (1-2% (107)) [the two other possible dinitro-2-chlorotoluenes have been prepd. by indirect means, viz., 2-chloro-3,4-dinitrotoluene, m.p.  $89^\circ$  (108), and 2-chloro-3,6-dinitrotoluene, m.p.  $62-63^\circ$  (109)].

[ $\bar{C}$  on monosulfonation with fuming  $H_2SO_4$  (37) or 100%  $H_2SO_4$  (23) (8) or  $ClSO_3H$  (110) (see below) yields 2-chlorotoluenesulfonic acid-5 [Beil. XI-95];  $\bar{C}$  sulfonates more readily (8) than *p*-chlorotoluene (3:8287) and may thus be used to separate  $\bar{C}$  from the latter (8) (111).]

⑤ 2-Chlorotoluenesulfonamide-6 (4-chloro-3-methylbenzenesulfonamide-1): cryst. from dil. alc., m.p.  $126^\circ$  u.c. (110). [From  $\bar{C}$  with  $ClSO_3H$  as directed (110) followed by conv. of the intermediate 2-chlorotoluenesulfonyl chloride-5, cryst. from pet. ether, m.p.  $63^\circ$  u.c. (110), with  $(NH_4)_2CO_3$ .]

B.P. 160° at 764 mm. (1)

[For prepn. of  $\bar{C}$  from  $\alpha$ -chloro-*n*-valeronitrile with  $\text{MeOH} + \text{H}_2\text{SO}_4$  see (1).]

3:8264 (1) Henry, *Bull. acad. roy. Belg.* (3) 36, 241-262 (1898); *Cent.* 1898, I 194.

[For study of system:  $\bar{C}$  +  $SbCl_5$  see (7).]

[ $\bar{C}$  with  $NH_3$  + cat. as directed (34) (35) yields *m*-toluidine;  $\bar{C}$  with aq.  $NaOH$  in pres. of  $Cu$  at 300–400° under press. yields (51) mixt. of *o*-cresol (1:1400), *m*-cresol (1:1730), and *p*-cresol (1:1410).]

[ $\bar{C}$  on mononitration, e.g., with 4 pts.  $HNO_3$  ( $D = 1.52$ ) nt 0°, gives a mixt. contg. (36) cf. (37) (13) (38) 59% 3-chloro-6-nitrotoluene [Beil. V-327,  $V_1$ -(162)], m.p. 24.9°, + 32% 3-chloro-4-nitrotoluene [Beil. V-329,  $V_1$ -(163)], m.p. 24.2°, + 9% 3-chloro-2-nitrotoluene [Beil. V-327,  $V_1$ -(162)], m.p. 23.4°. —  $\bar{C}$  on dinitration, e.g., with mixt. of 2 wt. pts.  $HNO_3$  ( $D = 1.52$ ) + 3 wt. pts. conc.  $H_2SO_4$  at room temp. for 12–18 hrs. (13), gives (95.8% yield (13)) 3-chloro-4,6-dinitrotoluene [Beil. V-344,  $V_1$ -(168)], cryst. from alc. or lgr., m.p. 91° (13) (38) (39), 90–90.5° (52) (note that the isomeric 3-chloro-2,6-dinitrotoluene [Beil.  $V_1$ -(168)] (40), m.p. 77° (40), and 3-chloro-2,4-dinitrotoluene, m.p. 92° (41), are also known but prepd. by indirect means). —  $\bar{C}$  on trinitration, e.g., by refluxing with 3 pts  $HNO_3$  (49.4°Bé) + 3 pts.  $H_2SO_4$  (66°Bé) at 160° (42), yields 3-chloro-2,4,6-trinitrotoluene [Beil. V-349], cryst. from  $C_6H_6$  + lgr., m.p. 150–151° (52), 148.5° (42).]

[ $\bar{C}$  with  $Na$  followed by  $CO_2$  as directed gives (yields: 88% (43A), 58% (43B)) *m*-toluic acid (1:0705), m.p. 110–111°, also obtd. in small yield (44) from  $\bar{C}$  + alc.  $KCN$  in pres. of  $NiCl_2$ , htd. in s.t. at 260–270° for 20 hrs.]

[ $\bar{C}$  with  $CrO_2Cl_2$  gives a cpd. which with aq. gives (44.5% yield (45)) *m*-chlorobenzaldehyde (3:6475).]

$\bar{C}$  on oxidn. with  $K_2Cr_2O_7$  +  $H_2SO_4$  (14), with 5% aq.  $KMnO_4$  (11) (46) or with dil.  $HNO_3$  in s.t. at 130–140° for 10 hrs. (15) gives (75% yield (46)) *m*-chlorobenzoic acid (3:4392).

③ 3-Chloro-6-sulfonamidotoluene (4-chloro-2-methylbenzenesulfonamide): cryst. from dil. alc., m.p. 184–185° u.c. (47). [From  $\bar{C}$  with  $ClSO_3H$  as directed (47) followed by treatment of the resultant 4-chloro-2-methylbenzenesulfonyl chloride, cryst. from pet. eth., m.p. 52–53° u.c. (47), 54° (49) with  $(NH_4)_2CO_3$ .]

[For prepn. of  $\bar{C}$  from *m*-toluidine [Beil. XII-853, XII-(397)] via diazotization and use of  $Cu_2Cl_2$  reactn. (yields: 86% (46), 80% (11)) (12) (13) or  $CuH$  (35% yield (48)) see indic. refs., from 3-chloro-4-aminotoluene [Beil. XII-939, XII-(436)] via diazotization followed by boilg. with alc. (60% yield (14)) or conversion to corresp. hydrazine and subsequent oxidn. with  $CuSO_4$  (50% yield (15)) see indic. refs.; from 5-chloro-2-aminotoluene [Beil. XII-335] with alc.  $H_2SO_4$  + ethyl nitrite (1) or by diazotization, reduction to the corresp. hydrazine, and oxidn. of latter with  $CuSO_4$  (43-63% yield (15)) see indic. refs.; for formn. of  $\bar{C}$  from 1-methylcyclohexanone-3 by conversion with  $PCl_5$  to 3-chloro-1-methylcyclohexene-2, treatment with  $Br_2$ , and boilg. with quinoline see (16); from 3-chloro-1-methylcyclohexadiene-1,3 [Beil. V-116] by conv. to dibromide and boilg. with quinoline see (17), from *m*-cresol (1:1730) with  $PCl_5$ , or from tri-(*m*-tolyl) phosphate at 210° see (18); for study of formn. of  $\bar{C}$  by partial rearr. with  $AlCl_3$  of *o*-chlorotoluene (3:8245) or *p*-chlorotoluene (3:8287) see (2).]

[ $\bar{C}$  with  $H_2$  in pres. of  $Pd/CaCO_3$  in alc./alk. soln. loses all its chlorine as  $HCl$  (19);  $\bar{C}$  with  $H_2$  in pres. of  $Pt$  in  $AcOH$  loses  $HCl$ , but no quant. data are given (20).]

[ $\bar{C}$  with  $Cl_2$  in pres. of  $Al/Hg$  yields (21) both 2,5-dichlorotoluene (3:6245) and 3,4-dichlorotoluene (3:6355) but no trace of any other isomers.]

[ $\bar{C}$  with  $Br_2$  in  $CCl_4$  at 60-80° in bright light (22) (23) or in  $CS_2$  (23) or  $\bar{C}$  at 130° with  $Br_2$  directly (24) gives (55% yield (22)) *m*-chlorobenzyl bromide, m p. 15-15.5°, b p. 103-105° at 8 mm. (22), b.p. 103-111° at 10 mm (24),  $D_4^{25} = 1.5652$  (22);  $\bar{C}$  with  $Br_2$  in  $CCl_4$  in pres. of  $Al/Hg$  (25) or  $\bar{C}$  with  $Br_2$  in  $AcOH$  in pres. of  $HNO_3$  or  $HNO_3/H_2SO_4$  (26) gives both 6-bromo-3-chlorotoluene, b.p. 120-125° at 15 mm. (26), 100-103° at 15 mm. (25) (note disagreement!), and 4-bromo-3-chlorotoluene, b.p. 90-93° at 12 mm. (26).] — [ $\bar{C}$  with  $Br_2$  in pres. of  $Be$  yields (27)  $\alpha,\gamma$ -dibromo-3-chlorotoluene, m.p. 96.5°.]

[ $\bar{C}$  with  $AlCl_3$  +  $HCl$  gas as directed undergoes partial rearr. (2) to both *o*-chlorotoluene (3:8245) and *p*-chlorotoluene (3:8287), for anal. of mixtures of the three isomers see (2).]

[ $\bar{C}$  with  $AcCl$  +  $AlCl_3$  in  $CS_2$  gives (60% yield (28)) 3-chloro-4-acetyltoluene (2-chloro-4-methylacetophenone), b.p. 260-262° at 760 mm. (28), b.p. 120-126° at 14 mm (29), accompanied (29) by some of the isomeric 3-chloro-6-acetyltoluene (4-chloro-2-methylacetophenone), b.p. 120-122° at 14 mm. (29). —  $\bar{C}$  with chloroacetyl chloride (3:5235) +  $AlCl_3$  in  $CS_2$  gives (70% yield (33)) 3-chloro-6-(chloroacetyl)toluene ( $\omega$ ,4-dichloro-2-methylacetophenone, m.p. 90° (33). —  $\bar{C}$  with  $\beta$ -chloropropionyl chloride (3:5690) +  $AlCl_3$  in  $CS_2$  gives (87% yield (50)) (30) 3-chloro-6-( $\beta$ -chloropropionyl)toluene which on ring closure with conc.  $H_2SO_4$  gives (50) (30) 5-chloro-7-methylindanone-1, m.p. 71° (50) (30). —  $\bar{C}$  with biphenyl-4,4'-bis-(carboxylic acid chloride) +  $AlCl_3$  yields (31) 4,4'-bis-(4-chloro-2-methylbenzoyl)-biphenyl (used in prepn. of bis-anthraquinonyl derivs.)]

[ $\bar{C}$  with trichloroacetonitrile +  $AlCl_3$  as directed (32) yields 4-chloro-2-methylbenzoic acid (3:4700).]

[Other reactns. involving only the OH group of  $\bar{C}$  include the following:  $\bar{C}$  with acetylene +  $BF_3$  +  $HgO$  gives (38% yield (30)) ethylidene bis-( $\gamma$ -chloro-*n*-propyl)acetal, b.p. 127-129° at 14 mm. (30);  $\bar{C}$  with benzonitrile +  $HCl$  gas in ether gives (31)  $\gamma$ -chloro-*n*-propyl iminobenzoate hydrochloride;  $\bar{C}$  with  $\beta$ -acetohomoglucose +  $Ag_2CO_3$  yields (32) tetra-acetyl- $\beta$ -d-( $\gamma$ -chloro-*n*-propyl)glucoside, m.p. 74° (for extension to prepn. of corresp. xyloside, galactoside, and lactoside see (32)).]

[ $\bar{C}$  with solid  $KOH$  loses  $HCl$  on htg. giving (16) (7) (10) (1) 1,3-epoxypropane (trimethylene oxide) [Beil. XVII-6, XVII-3]], b.p. 47.8° at 760 mm.,  $D_4^{25} = 0.8930$ ,  $n_D^{25} = 1.3897$  (16) (for study of rate of reactn. see (33)).]

[ $\bar{C}$  with  $NaOEt$  in abs. alc. reacts vigorously giving (38% yield (34)) ethyl  $\gamma$ -hydroxy-*n*-propyl ether (trimethylene glycol monoethyl ether) [Beil. I-476, I-(247)], b.p. 160-161° (34), 162.1-162.2°,  $D_4^{20} = 0.91691$ ,  $n_D^{20} = 1.41666$  (35), accompanied by some trimethylene glycol diethyl ether, b.p. 140° (34). —  $\bar{C}$  with  $NnSH$  as directed gives (70-80% yield (34))  $\gamma$ -hydroxy-*n*-propyl mercaptan, b.p. 85-90° at 15 mm. ( $Hg$  mercaptide =  $Hg(SCH_2CH_2CH_2OH)_2$ , pl. from butanol, m.p. 132-134° (36). —  $\bar{C}$  with aq.  $Na_2S$  gives (36) bis-( $\gamma$ -hydroxy-*n*-propyl) sulfide, visc. oil which could be neither distd. nor crystd. but which with phenyl isocyanate gave the corresp. bis-(phenylcarbamate), m.p. 146-148° (36). —  $\bar{C}$  with  $NaSCH_3$  in ether gives (76% yield (42))  $\gamma$ -hydroxy-*n*-propyl methyl sulfide, b.p. 105-105.5° at 30 mm. (42). —  $\bar{C}$  with benzyl mercaptan in alc. gives (88% yield (43)) benzyl  $\gamma$ -hydroxy-*n*-propyl sulfide, b.p. 185° at 19 mm. (43).]

[ $\bar{C}$  in alk. medium reacts with phenols yielding corresp. subst. alcohols; e.g.,  $\bar{C}$  with phenol + alc.  $NaOEt$  (75% yield (37)) or  $\bar{C}$  + phenol + aq.  $NaOH$  (80% yield (38) (39)) gives 3-phenoxypropanol-1, b.p. 153-160° at 25 mm.,  $n_D^{20} = 1.491$  (37) which with  $ZnCl_2$  at 215° loses aq. and ring-closes (37) to chromane [Beil. XVII-52, XVII-(22)]; for corresp. reactn. with *o*-cresol (40), with *m*-cresol (41), *p*-cresol (41),  $\beta$ -naphthol (40), or resorcinol (40) see indic. refs.]

[ $\bar{C}$  with prim. or sec. amines splits out  $HCl$  yielding corresp. subst. aminoalcohols; e.g., for reactn. of  $\bar{C}$  with aniline + anhydrous  $Na_2CO_3$  giving (67.5% yield) 3-(*N*-phenylamino)propanol-1 (37) (4 hydroxy- $\gamma$ -phenylamino) b.p. 102° at 20 mm.,  $D_{28}^{25} = 1.063$ ,  $n_D^{25} = 1.4743$ ,  $n_D^{20} = 1.4762$ , see (76); for  $\bar{C}$  with acetone + sec. amines see (47) (55); for  $\bar{C}$  with morpholine giving (75% yield) 3-(morpholino)propanol-1, b.p. 147-149° at 21 mm.,  $n_D^{25} = 1.4743$ ,  $n_D^{20} = 1.4762$ , see (76); for  $\bar{C}$  with piperidine see (48) (56).] —

[ $\bar{C}$  with *ter*-amines yields corresp. quat. ammon. salts; e.g.,  $\bar{C}$  with  $(CH_3)_3N$  in  $C_6H_6$  in s.t. at 100° for 8 hrs. gives (92% yield (49))  $\gamma$ -homocholine chloride, m.p. 173° (49);  $\bar{C}$  with pyridine gives (85% yield (50))  $\gamma$ -hydroxy-*n*-propyl pyridinium chloride, oil.] — [For reactn. of  $\bar{C}$  with arsanilic acid (*p*-aminobenzenearsonic acid) (51), with *p*-hydroxybenzenearsonic acid (52), with ethyl  $\beta$ -methylaminopropionate (53), or with various carbazole derivs. (54) see indic. refs.]

[ $\bar{C}$  with 1 mole thiourea htd. at 120-125° yields (57) *S*-( $\gamma$ -hydroxy-*n*-propyl)isothiourrea hydrochloride, cryst. from butanol, m.p. 130° (57);  $\bar{C}$  with dry sodium *p*-toluenesulfonamide htd. at 160-170° for 18 hrs. yields (58) *N*-( $\gamma$ -hydroxy-*n*-propyl)-*p*-toluenesulfonamide as an oil.]

[For study of rate of reactn. of  $\bar{C}$  with  $KI$  in acetone at 35° and 45° see (39); for reactn. of  $\bar{C}$  with  $Na_3AsO_3$  see (5).]

—  $\gamma$ -Chloro-*n*-propyl acetate [Beil. II-(48), II-(139)]: liq., b.p. 168-169° (59), 165-166° (60), 88-90° at 22 mm. (61), 66° at 14 mm. (17), 62-63° at 10 mm. (7)  $D_{21}^{25} = 1.1105$  (7);  $n_D^{25} = 1.431$  (7). ## 3: 0720 ETHYLENE GLYCOL bis-CHLOROACETATE

 $C_6H_{10}O_4Cl_2$ 

Beil S.N. 160

 $ClCH_2.CO.O.CH_2$ 

$$\begin{array}{c} | \\ ClCH_2.CO.O.CH_2 \end{array}$$

M.P. 45-46.5° (1) B.P. 142-144° at 2 mm. (1)

Cryst. from ether/pet. eth. — Insol. aq. (dif. from  $\beta$ -hydroxyethyl chloroacetate (3:6780)).

[For prepn. of  $\bar{C}$  from ethylene oxide (1:6105) with chloroacetic acid (3:1370) as by-product of prepn. of  $\beta$ -hydroxyethyl chloroacetate (3:6780) see (1); note also that  $\bar{C}$  is formed (together with ethylene glycol (1:6165)) by disproportionation of  $\beta$ -hydroxyethyl chloroacetate (3:6780) on long stdg. in ord. glass bottles (1).]

$\bar{C}$  on shaking with aq. is hydrolyzed only very slowly (1).

[For use of  $\bar{C}$  as insecticide, fungicide, and disinfectant see (2).]

3: 0720 (1) Meerwein, Sönke, *J. prakt. Chem.* (2) **137**, 316-318 (1933). (2) Peet (to Rohm and Haas Co.), U.S. 1,816,441, July 28, 1931; *Cent.* **1932**, I 1146; C.A. **25**, 5501 (1931); French 667,633, Oct. 18, 1929; *Cent.* **1930**, I 2614.

trimethylene glycol (1:6490) with  $\text{Ac}_2\text{O} + \text{S}_2\text{Cl}_2$  (68% yield (17)).] — [This acetate with solid KOH loses HOAc giving (16) (7) (61) 2,3-epoxypropane (trimethylene oxide) (see above).]

—  $\gamma$ -Chloro-*n*-propyl benzoate: oil, b.p. 154–156° at 22 mm. (31), 155–156° at 15 mm. (4), 133–134° at 2 mm. (39),  $D_4^{22} = 1.1672$  (31),  $n_D^{20} = 1.5136$  (31). [From  $\bar{\text{C}} + \text{BzCl}$  (yields: 84% (39), 75% (4)) or from  $\gamma$ -chloro-*n*-propyl iminobenzoate hydrochloride (see above) by hydrol. (31).] — [For reactn. of this ester with pyrrolidine (63), pyrroline (63), piperidine (56), aubat. piperidines (64) (65) (68), hydrogenated quinolines (66), or with *N*-methyl-phenyl-alkylamines (67) see indic. refs.]

—  $\gamma$ -Chloro-*n*-propyl *p*-nitrobenzoate: oil, b.p. 163.5–169.5° at 2 mm.,  $D_{25}^{25} = 1.3222$ ,  $n_D^{25} = 1.54736$  (67). [From  $\bar{\text{C}} + p$ -nitrobenzoyl chloride on htg. (67).]

⑥  $\gamma$ -Chloro-*n*-propyl 3,5-dinitrobenzoate: colorless pl. from lt. pet., m.p. 77° (17). [From  $\bar{\text{C}} + 3,5$ -dinitrobenzoyl chloride (17).]

—  $\gamma$ -Chloro-*n*-propyl hydrogen phthalate: unreported.

—  $\gamma$ -Chloro-*n*-propyl hydrogen 3-nitrophthalate: unreported.

—  $\gamma$ -Chloro-*n*-propyl benzene sulfonate: unreported.

—  $\gamma$ -Chloro-*n*-propyl *p*-toluenesulfonate: oil, b.p. 216–219° at 17 mm. (69), 188–192° at 5 mm (24),  $D_4^{20} = 1.2674$  (69),  $D_{25}^{25} = 1.2396$  (24),  $n_D^{20} = 1.5230$  (69),  $n_D^{25} = 1.5225$  (24). [From  $\bar{\text{C}} + p$ -toluenesulfonyl chloride on htg. (69) or with aq. NaOH at 15° (50–55% yield (24)).] — [For reactn. of this ester with  $\text{RMgX}$  cpds. see (69) (24), with various sodium acetylides see (70).]

—  $\gamma$ -Chloro-*n*-propyl carbamate: pearly cryst. from hot. aq., m.p. 62° (29). [From  $\bar{\text{C}}$  with urea nitrate (2 moles) on htg. at 130–135° (16% yield (29)) or from  $\gamma$ -chloro-*n*-propyl chloroformate (3:6010) with conc. aq.  $\text{NH}_4\text{OH}$  (29).]

—  $\gamma$ -Chloro-*n*-propyl *N*-(phenyl)carbamate: ndls. from alc., m.p. 35° (29), m.p. 35–36° (28), b.p. 190° at 3.5 mm. (28). [From  $\bar{\text{C}} + \text{phenyl isocyanate at } 150^\circ$  (29) or from  $\gamma$ -chloro-*n*-propyl chloroformate (3:6010) with aniline (29).]

—  $\gamma$ -Chloro-*n*-propyl *N*-(*p*-nitrophenyl)carbamate: unreported.

⑦  $\gamma$ -Chloro-*n*-propyl *N*-( $\alpha$ -naphthyl)carbamate, cryst. from hot lgr., m.p. 78° (71) (17), 76.5° (9), 75.5–76.5° (28). [From  $\bar{\text{C}} + \alpha$ -naphthyl isocyanate (71).]

⑧ *N*-( $\gamma$ -Hydroxy-*n*-propyl)phthalimide [3-(*N*-phthalimido)propanol-1] [Beil. XXI-472]: cryst. from aq., m.p. 75° (72), 74° (73), 88° (74). [From  $\bar{\text{C}} + \text{K phthalimide at } 190^\circ$  (73); also indirectly as cited in other indicated refs.]

⑨ *N*-( $\gamma$ -Hydroxy-*n*-propyl)tetrachlorophthalimide [3-(*N*-tetrachlorophthalimido)propanol-1]: pr. from acetone, m.p. 165–166° (75). [From  $\bar{\text{C}}$  with K tetrachlorophthalimide as directed (75).]

See also Note 1.

Note 1. For further data on b.p. of  $\bar{C}$  at 16 pressures from 74–764 mm. see (4).

Note 2. For effect of press. on m.p. see (20).

Note 3. For data on  $D_4^1$  from  $t = 25^\circ$  to  $t = 160^\circ$  see (16) (4); note also  $D_{20}^{20} = 1.0714$  (8).

Note 4. For  $n_D^{19}$ /compn. data on system:  $\bar{C}$  + *o*-chlorotoluene (3:8245) see (22).

$\bar{C}$  with aq. forms a const.-boil. mixt., b.p.  $95^\circ$  (use in sepn. of  $\bar{C}$  from polychlorotoluenes (23)). — For f.p./compn. data on system:  $\bar{C}$  + *o*-chlorotoluene (3:8245) (eutectic, f.p.  $-49.8^\circ$ , contg. 27 wt %  $\bar{C}$ ) see (8) (147); for  $D_{20}^{20}$ /compn. data (8) and for  $n_D^{19}$ /compn. data (22) on this system see indic. refs. — For f.p./compn. data on systems of  $\bar{C}$  with *p*-bromotoluene or with *p*-fluorotoluene see (19). — For data on const.-boil. mixts. of  $\bar{C}$  with various org. cpds. see Beil. V<sub>2</sub>-(227). — For cryoscopic constant (i.e., lowering of f.p. per mole solute per 1000 g  $\bar{C}$ ) viz., 5.53 (12), 5.6 (24), 5.07 (25), see indic. refs.; for use in detn. of  $\bar{C}$  in mixt. with *o*-chlorotoluene (3:8245) and *m*-chlorotoluene (3:8275) see (25).

[For prepn. of  $\bar{C}$  from *p*-toluidine via diazotization in HCl and warming the resultant solution as such (yields: 60% (26), 40–44% (27)) (28) or in pres. of  $Cu_2Cl_2$  (yields: 95% (33), 88–89% (29), 81% (31), 70–79% (30), 63.5% (32)) (for study of kinetics of this reaction see (34) (35)), or in pres. of Cu powder (63.8% yield (36)), or in pres. of CuH (64% yield (37)), or by electrolysis between Cu electrodes in pres. of  $CuCl_2$  (38) see indic. refs.; for prepn. of  $\bar{C}$  from *p*-toluidine via diazotization, conversion to solid *p*-toluenediazonium chloride, and subsequent warming with  $C_6H_6$  +  $AlCl_3$  (39), or via diazotization, conversion of diazonium salt to its cpd. with  $PbCl_4$ , and subsequent htg. of latter in naphthalene at  $150^\circ$  (40), see indic. refs.]

[For formn. of  $\bar{C}$  (usually together with other prods.) from toluene (1:7405) with  $Cl_2$  (70) in pres. of Fe in diffuse light in cold (8) (gives mixt. contg. 42%  $\bar{C}$  + 58% *o*-chlorotoluene (3:8245) (8) (22)), or in pres. of  $I_2$  (22) (41) (42), or in pres. of  $PbCl_2$  (8),  $SbCl_3$  (41),  $MoCl_3$  (43) (28) (44), or  $Al/Hg$  (45); for formn. of  $\bar{C}$  from toluene by electrolysis in strong HCl (46) or in AcOH/conc. HCl in dark (47) see indic. refs.; for formn. of  $\bar{C}$  from toluene with  $SO_2Cl_2$  at  $160^\circ$  (48), with  $SO_2Cl_2$  in pres. of various cat. in dark (49), with  $SO_2Cl_2$  +  $AlCl_3$  +  $S_2Cl_2$  at  $70^\circ$  (50), with pyrosulfuryl chloride +  $AlCl_3$  at  $0^\circ$  (51), with HCl +  $HNO_3$  at  $100^\circ$  (52), with *n*-butyl chlorosulfonate +  $AlCl_3$  (6.2% yield (53)), with anhydrous  $FeCl_3$  after refluxing  $1\frac{1}{2}$  hrs. (65% yield (54)), or with  $NCl_3$  (55) see indic. refs.]

[For formn. of  $\bar{C}$  from *o*-chlorotoluene (3:8245) or *m*-chlorotoluene (3:8275) by partial rearr. with  $AlCl_3$  + HCl gas see (25); from tetra-(*p*-tolyl)tin with  $Cl_2$  in  $CHCl_3$  (85% yield (6)) or from tri-(*p*-tolyl)stibine dichloride on htg. under 5–7 mm. press. at  $60$ – $65^\circ$  (56) (note that at  $160$ – $200^\circ$  di-(*p*-tolyl)stibine chloride is formed (56)) or from tri-(*p*-tolyl)-phosphite dichloride by htg. at  $200$ – $210^\circ$  (57) see indic. refs.; from *p*-tolyl  $MgBr$  in ether with  $Cl_2$  (58) or with benzenesulfonyl chloride (59) see indic. refs.; from *p*-toluenediazopiperidine with conc. HCl see (60); from *p*-chlorobenzaldehyde (3:0765) on elec. reduction in acid soln. with Cu cathode see (61); from chlorobenzene (3:7903) via condensation with  $CH_2O$  + HCl to *p*-chlorobenzyl chloride (3:0220) and subsequent reductn. with  $Zn$  + NaOH see (62)]

[ $\bar{C}$  on pyrolysis over red-hot Pt yields (63) mainly 4,4'-dichlorodihenzyl (1,2-bis-(p-chlorophenyl)ethane [Beil. V-600, V<sub>1</sub>-(281), V<sub>2</sub>-(507)], colorless lfts. from alc., m.p. 112°, accompanied by a very small amt. 4,4'-dichlorostilbene (1,2-bis-(p-chlorophenyl)ethylene) [Beil. V<sub>1</sub>-(304), V<sub>2</sub>-(539)], ndls. from alc., m.p. 170°].

[ $\bar{C}$  with H<sub>2</sub> in pres. of Pd/CaCO<sub>3</sub> (64) or reduced Ni (65) in alc./alk. soln. loses all its halogen as HCl;  $\bar{C}$  with Na in liq. NH<sub>3</sub> as directed (66) yields toluene and other prods.;  $\bar{C}$  with HI + P in s.t. at 302° for 5 hrs. gives (80% yield (67)) toluene.]

$\bar{C}$  on oxidn. with 3 pts. KMnO<sub>4</sub> in dil. aq. soln. under reflux for 4-5 hrs. (68) (51), or with CrO<sub>3</sub> (42), or with dil. HNO<sub>3</sub>, e.g., with 6 pts. of dil. HNO<sub>3</sub> (1 vol. conc. HNO<sub>3</sub> + 2 vols. aq.) at 145° for 1½ hrs. (69) or at 115-120° for 5-6 hrs. (70), yields p-chlorobenzoic acid (3:4940), m.p. 243° (for use in quant. estn. of  $\bar{C}$  in pres. of toluene, benzyl chloride, and o-chlorotoluene see (70)). — Note that with HNO<sub>3</sub>  $\bar{C}$  is more rapidly oxidized than o-chlorotoluene, m-chlorotoluene, or the various dichlorotoluenes but more slowly than p-bromotoluene (69). —  $\bar{C}$  on oxidn. with air at 260° in pres. of Na<sub>2</sub>CO<sub>3</sub> and under press. (71), or on vapor-phase oxidn. over suitable cat. (72), or on electrolytic oxidn. in dil. Na<sub>2</sub>CO<sub>3</sub> soln. at 60° (73) cf. (74), or even on very long atdg. (2 years) with I<sub>2</sub> + aq. in sunlight (75) gives p-chlorobenzoic acid. —  $\bar{C}$  with N<sub>2</sub>O<sub>4</sub> yields (76) p-chlorobenzoic acid accompanied by nitration prods.

[ $\bar{C}$  with chromyl chlorida (CrO<sub>2</sub>Cl<sub>2</sub>) yields an addn. prod. which with aq. gives in good yield (77) p-chlorobenzaldehyde (3:0765). —  $\bar{C}$  with air in aq. susp. of FeO.OH + cat. at 235-240° and 50-60 atm. press. gives (78) a mixt. of p-chlorobenzaldehyde (3:0765) + p-chlorobenzoic acid (3:4940).]

[ $\bar{C}$  with Cl<sub>2</sub> or on htg. with PhCl<sub>2</sub>.2NH<sub>4</sub>Cl or with SO<sub>2</sub>Cl<sub>2</sub> in pres. of dihenzoyl peroxida in dark yields p-chlorobenzyl chloride (3:0220), q.v. for relevant refs. —  $\bar{C}$  with 2 moles Cl<sub>2</sub> in pres. of 5% PCl<sub>5</sub> at 160-170° gives (79) (80) p-chlorobenzal (di)chlorida (3:6700). —  $\bar{C}$  with 3 moles Cl<sub>2</sub> at high temp. in u.v. light (81) cf. (82) or with 3 moles Cl<sub>2</sub> (83) in pres. of FeCl<sub>3</sub> (84) or of PCl<sub>5</sub> (85) (86) gives (93% yield (85)) p-chlorobenzotrichloride (3:6325) q.v. —  $\bar{C}$  with Cl<sub>2</sub> (1 mole) in pres. of 1% Fe or 40% PhCl<sub>2</sub> at 20° gives (65% yield (87)) a mixt. comprising 68.4% 2,4-dichlorotoluene (3:6290) + 41.6% 3,4-dichlorotoluene (3:6355).]

[ $\bar{C}$  with Br<sub>2</sub> at 130° (88) or at 160° (89) (90) or in pres. of dihenzoyl peroxide in dark at 100° (91) gives (21% yield (90)) exclusively (91) p-chlorobenzyl bromide [Beil. V-307, V<sub>2</sub>-(239)], cryst. from MeOH, m.p. 62-63° (88), ndls. from 85% alc., m.p. 50° (90), 51° (79), 48.5° (89); for study of rate of side-chain bromination of  $\bar{C}$  in CS<sub>2</sub> at 57° see (92). —  $\bar{C}$  with 2 moles Br<sub>2</sub> in pres. of BeBr<sub>2</sub> (93) or in AcOH + fumg. HNO<sub>3</sub> + fumg. H<sub>2</sub>SO<sub>4</sub> (94) gives p-chlorobenzal (di)bromide, m.p. 99° (93).]

[ $\bar{C}$  with AlCl<sub>3</sub> + HCl gas as directed (25) undergoes partial rearr. to both o-chlorotoluene (3:8245) and m-chlorotoluene (3:8275); for anal. of mixts. of the three isomers see (25).]

[ $\bar{C}$  with AcCl (95) or better Ac<sub>2</sub>O (96) (97) + AlCl<sub>3</sub> in CS<sub>2</sub> (98) gives (yields: 85% in 4 hrs. (97), 65% (98), 34% in 2 hrs. (96)) 2-chloro-5-methylacetophenone [Beil. VII-307], h.p. 245.8-246.0° at 760.1 mm. (96),  $n_D^{25} = 1.5419$  (96). —  $\bar{C}$  with  $\beta$ -chloropropionyl chloride (3:5690) + AlCl<sub>3</sub> in CS<sub>2</sub> gives (87% yield (99)) (100) 4-chloro-3-( $\beta$ -chloropropionyl)toluene, oil, which on ring closure with conc. H<sub>2</sub>SO<sub>4</sub> gives (72% yield (99)) (100) 7-chloro-4-methylindanone-1, cryst. from MeOH, m.p. 128° (99) (100). —  $\bar{C}$  with trichloroacetonitrile + AlCl<sub>3</sub> (4 moles) at 80-90° satd. with HCl gas for 2 days gives only 6% yield (101) of a mixt. of 2-chloro-5-methyl- and 5-chloro-2-methyl- $\omega,\omega,\omega$ -trichloroacetophenones.]

[ $\bar{C}$  with oxalyl (di)chloride (3:5060) + AlCl<sub>3</sub> in CS<sub>2</sub> for 20 hrs. at room temp. gives (40% yield (102)) 2-chloro-5-methylbenzoic acid (6-chloro-3-methylbenzoic acid) (3:4615), cryst. from aq., m.p. 163-166° (102), accompanied by some dichlorodimethyl-benzophenone, m.p. 70°, whose structure was not detd. —  $\bar{C}$  with fumaryl (di)chloride (3:5875) + AlCl<sub>3</sub>

in  $\text{CS}_2$  at 50–60° for 2 hrs. gives (25% yield (103)) *bis*-1,2-(2-chloro-5-methylbenzoyl)-ethylene, pale yel. cryst. from alc., m.p. 158° (103).]

[ $\bar{\text{C}}$  with benzoyl chloride +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (50% yield (98)) (104) (105) 2-chloro-5-methylbenzophenone (6-chloro-3-methylbenzophenone) [Beil. VII<sub>1</sub>-(235)], cryst. from  $\text{AcOH}$ , m.p. 35–36° (98) (104) (105), together with 5-chloro-2-methyl-(3-chloro-6-methyl)-benzophenone [Beil. VII<sub>1</sub>-(235)], oil, b.p. 210° at 30 mm. (106). —  $\bar{\text{C}}$  with *o*-chlorobenzoyl chloride (3:6640) +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (106) 5,2'-dichloro-2-methylbenzophenone [Beil. VII<sub>1</sub>-(235)], oil, b.p. 225° at 12 mm. (106).]

[ $\bar{\text{C}}$  with phthalic anhydride (1:0725) +  $\text{AlCl}_3$  gives (62.5% yield on the phthalic anhydride (107)) *o*-(2-chloro-5-methylbenzoyl)benzoic acid, ndls. from  $\text{C}_6\text{H}_6$ , m.p. 164–165° (107), 165° (108), which with conc.  $\text{H}_2\text{SO}_4$  at 75° for 4 hrs. (108) or with 8 pts. fuming  $\text{H}_2\text{SO}_4$  (20%  $\text{SO}_3$ ) (107) ring-closes to give (yields: 93% (107), 85% (108)) 1-chloro-4-methyl-anthraquinone [Beil. VII-809, VII<sub>1</sub>-(421)], yel. ndls. from  $\text{AcOH}$  or alc., m.p. 164° (107) (108). — Note that the structure of the above keto acid, m.p. 164–165°, has been definitely established (109) as shown and that it is *not* the isomeric *o*-(5-chloro-2-methylbenzoyl)-benzoic acid, which appears to be still unreported. — For reactn. of  $\bar{\text{C}}$  with 3,6-dichlorophthalic anhydride (3:4860) (110) or with pyromellitic anhydride (111) in pres. of  $\text{AlCl}_3$  see indic. refs.]

[ $\bar{\text{C}}$  does *not* (112) react with *bis*-(chloromethyl) ether (3:5245), but  $\bar{\text{C}}$  with formalin + conc.  $\text{HCl}$  yields (62) 4-chloro-3-(chloromethyl)toluene since on reductn. with  $\text{Zn}$  +  $\text{NaOH}$  the prod. gives 4-chloro-1,3-dimethylbenzene (3:8665). —  $\bar{\text{C}}$  with aq. vapor +  $\text{CO}$  over suitable cat. at 300–400° yields (113) *p*-toluic acid (1:0705). —  $\bar{\text{C}}$  with  $\text{NH}_3$  +  $\text{CO}$  over suitable cat. as directed (114) yields *p*-toluidine (see also below). —  $\bar{\text{C}}$  with  $\text{S}_2\text{Cl}_2$  +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (115) 4,5-dichloro-1,8-dimethylthianthrene, m.p. 195–197° (115).]

[ $\bar{\text{C}}$  with  $\text{Li}$  in ether gives (63% yield (116)) *p*-tolyllithium;  $\bar{\text{C}}$  with  $\text{Li}$  at 150° followed by treatment with aq. gives (117) toluene + 4,4'-dimethylhiphenyl. —  $\bar{\text{C}}$  with  $\text{Na}$  in  $\text{C}_6\text{H}_6$  treated with  $\text{CO}_2$  at ord. temp. (118) (119) or at 50° and 500 lbs. press. (120) cf. (121) gives (yields: 05% (120), 76% (121)) *p*-toluic acid (1:0705), m.p. 178°. —  $\bar{\text{C}}$  with  $\text{Na}$  treated with benzophenone as directed (122) yields diphenyl-*p*-tolyl-carbinol [Beil. VI-722, VI<sub>1</sub>-(355)], m.p. 72–73°.]

[ $\bar{\text{C}}$  on hydrolysis with aq. vapor over silica gel contg. 3% finely divided  $\text{Ni}$  at 380° (123), or with aq. vapor over cat. at 480° (124), or with aq.  $\text{Na}_2\text{CO}_3$  in pres. of  $\text{Cu}$  at 300° under press. (125), or with 15–20% aq.  $\text{NaOH}$  at 300° (126) gives (80% yield (123)) *p*-cresol (1:1410). Note, however, claim (127) that  $\bar{\text{C}}$  when hydrolyzed with 15% aq.  $\text{NaOH}$  in pres. of  $\text{Cu}$  for 2 hrs. at 315–320° yields prod. contg. not only *p*-cresol (1:1410) but also *m*-cresol (1:1730) (for extensive study of hydrolysis of  $\bar{\text{C}}$  as means of prepn. of *m*-cresol see (147)). —  $\bar{\text{C}}$  with  $\text{H}_2\text{S}$  at 700° over suitable cat. yields (128) thio-*p*-cresol (*p*-tolyl-mercaptan).]

[ $\bar{\text{C}}$  with aq.  $\text{NH}_4\text{OH}$  +  $\text{CuO}$  at 150–250° under press. (129) or  $\bar{\text{C}}$  + aq.  $\text{NH}_4\text{OH}$  +  $\text{Cu}$  salts + various anti acids at 225–230° under press. (130) (131) yields *p*-toluidine and/or di-*p*-tolylamine. —  $\bar{\text{C}}$  with  $\text{KNH}_2$  in liq.  $\text{NH}_3$  (132) or  $\text{Na}$  in liq.  $\text{NH}_3$  (66) yields *p*-toluidine. — Note that  $\bar{\text{C}}$  does not react with aq. sodium sulfanilate +  $\text{Na}_2\text{CO}_3$  (dif. from benzyl chloride (3:8535) and use in sepn. of  $\bar{\text{C}}$  from latter (8)).]

[ $\bar{\text{C}}$  on mononitration yields a mixt. contg. both 4-chloro-2-nitrotoluene [Beil. V-327, V<sub>1</sub>-(162), V<sub>2</sub>-(251)], m.p. 38 2° (133), 37–38° (10), 37° (29) (22), b.p. 239 5–240° at 718 mm. (134), 115.5° at 11 mm. (22) (easily volatile with steam, but not reacting with piperidine even after 8 hrs. at 100° (10)), and 4-chloro-3-nitrotoluene [Beil. V-329, V<sub>2</sub>-(252)], m.p. 7° (135), 5 8° (133), b.p. 260° at 745 mm. (135), 118° at 11 mm. (22) (reacts readily with piperidine at 100° (10)); e.g.,  $\bar{\text{C}}$  added in 2 equal portions to 3 wt. pts.  $\text{HNO}_3$  ( $D = 1.5$ ) at 0° gives 88% yield of mixt. contg. 53.8% 4-chloro-2-nitrotoluene + 41.2% 4-chloro-3-

[ $\bar{C}$  on pyrolysis over red-hot Pt yields (63) mainly 4,4'-dichlorodibenzyl (1,2-bis-(p-chlorophenyl)ethane [Beil. V-600, V<sub>1</sub>-(281), V<sub>2</sub>-(507)], colorless lfts. from alc., m.p. 112°, accompanied by a very small amt. 4,4'-dichlorostilbene (1,2-bis-(p-chlorophenyl)ethylene) [Beil. V<sub>1</sub>-(304), V<sub>2</sub>-(539)], ndls. from alc., m.p. 170°.]

[ $\bar{C}$  with H<sub>2</sub> in pres. of Pd/CaCO<sub>3</sub> (64) or reduced Ni (65) in alc./alk. soln. loses all its halogen as HCl;  $\bar{C}$  with Na in liq. NH<sub>3</sub> as directed (66) yields toluene and other prods.;  $\bar{C}$  with HI + P in s.t. at 302° for 5 hrs. gives (80% yield (67)) toluene.]

$\bar{C}$  on oxidn. with 3 pts. KMnO<sub>4</sub> in dil. aq. soln. under reflux for 4-5 hrs. (68) (51), or with CrO<sub>3</sub> (42), or with dil. HNO<sub>3</sub>, e.g., with 6 pts. of dil. HNO<sub>3</sub> (1 vol. conc. HNO<sub>3</sub> + 2 vols. aq.) at 145° for 1½ hrs. (69) or at 115-120° for 5-6 hrs. (70), yields p-chlorobenzoic acid (3:4940), m.p. 243° (for use in quant. estn. of  $\bar{C}$  in pres. of toluene, benzyl chloride, and o-chlorotoluene see (70)). — Note that with HNO<sub>3</sub>  $\bar{C}$  is more rapidly oxidized than o-chlorotoluene, m-chlorotoluene, or the various dichlorotoluenes but more slowly than p-bromotoluene (69). —  $\bar{C}$  on oxidn. with air at 260° in pres. of Na<sub>2</sub>CO<sub>3</sub> and under press. (71), or on vapor-phase oxidn. over suitable cat. (72), or on electrolytic oxidn. in dil. Na<sub>2</sub>CO<sub>3</sub> soln. at 60° (73) cf. (74), or even on very long stdg. (2 years) with I<sub>2</sub> + aq. in sunlight (75) gives p-chlorobenzoic acid. —  $\bar{C}$  with N<sub>2</sub>O<sub>4</sub> yields (76) p-chlorobenzoic acid accompanied by nitration prods.

[ $\bar{C}$  with chromyl chloride (CrO<sub>2</sub>Cl<sub>2</sub>) yields an addn. prod. which with aq. gives in good yield (77) p-chlorobenzaldehyde (3:0765). —  $\bar{C}$  with air in aq. susp. of FeO.OH + cat. at 235-240° and 50-60 ntm. press. gives (78) a mixt. of p-chlorobenzaldehyde (3:0765) + p-chlorobenzoic acid (3:4940).]

[ $\bar{C}$  with Cl<sub>2</sub> or on htg with PbCl<sub>4</sub>·2NH<sub>4</sub>Cl or with SO<sub>2</sub>Cl<sub>2</sub> in pres. of dibenzoyl peroxide in dark yields p-chlorobenzyl chloride (3:0220), q.v. for relevant refs. —  $\bar{C}$  with 2 moles Cl<sub>2</sub> in pres. of 5% PCl<sub>5</sub> at 160-170° gives (79) (80) p-chlorobenzal (di)chloride (3:6700). —  $\bar{C}$  with 3 moles Cl<sub>2</sub> at high temp. in u.v. light (81) cf. (82) or with 3 moles Cl<sub>2</sub> (83) in pres. of FeCl<sub>3</sub> (84) or of PCl<sub>5</sub> (85) (86) gives (93% yield (85)) p-chlorobenzotrichloride (3:6825) q.v. —  $\bar{C}$  with Cl<sub>2</sub> (1 mole) in pres. of 1% Fe or 40% PbCl<sub>2</sub> at 20° gives (65% yield (87)) a mixt. comprising 58.4% 2,4-dichlorotoluene (3:6290) + 41.6% 3,4-dichlorotoluene (3:6355).]

[ $\bar{C}$  with Br<sub>2</sub> at 130° (88) or at 160° (89) (90) or in pres. of dibenzoyl peroxide in dark at 100° (91) gives (21% yield (90)) exclusively (91) p-chlorobenzyl bromide [Beil. V-307, V<sub>2</sub>-(239)], cryst. from MeOH, m.p. 62-63° (88), ndls. from 85% alc., m.p. 50° (90), 51° (79), 48.5° (89); for study of rate of side-chain bromination of  $\bar{C}$  in CS<sub>2</sub> at 57° see (92). —  $\bar{C}$  with 2 moles Br<sub>2</sub> in pres. of BeBr<sub>2</sub> (93) or in AcOH + fumg. HNO<sub>3</sub> + fumg. H<sub>2</sub>SO<sub>4</sub> (94) gives p-chlorobenzal (di)bromide, m.p. 99° (93).]

[ $\bar{C}$  with AlCl<sub>3</sub> + HCl gas as directed (25) undergoes partial rearr. to both o-chlorotoluene (3:8245) and m-chlorotoluene (3:8275); for anal. of mixts. of the three isomers see (25).]

[ $\bar{C}$  with AcCl (95) or better Ac<sub>2</sub>O (96) (97) + AlCl<sub>3</sub> in CS<sub>2</sub> (98) gives (yields: 85% in 4 hrs. (97), 65% (98), 34% in 2 hrs. (96)) 2-chloro-5-methylacetophenone [Beil. VII-307], b.p. 245.8-246.0° at 760.1 mm. (96),  $n_D^{25}$  = 1.5419 (96). —  $\bar{C}$  with  $\beta$ -chloropropionyl chloride (3:5690) + AlCl<sub>3</sub> in CS<sub>2</sub> gives (87% yield (99)) (100) 4-chloro-3-( $\beta$ -chloropropionyl)toluene, oil, which on ring closure with conc. H<sub>2</sub>SO<sub>4</sub> gives (72% yield (99)) (100) 7-chloro-4-methylindanone-1, cryst. from MeOH, m.p. 128° (99) (100). —  $\bar{C}$  with trichloroacetoneitrile + AlCl<sub>3</sub> (4 moles) at 80-90° satd. with HCl gas for 2 days gives only 5% yield (101) of a mixt. of 2-chloro-5-methyl- and 5-chloro-2-methyl- $\omega,\omega,\omega$ -trichloroacetophenones.]

[ $\bar{C}$  with oxalyl (di)chloride (3:5060) + AlCl<sub>3</sub> in CS<sub>2</sub> for 20 hrs. at room temp. gives (40% yield (102)) 2-chloro-5-methylbenzoic acid (6-chloro-3-methylbenzoic acid) (3:4615), cryst. from aq., m.p. 163-166° (102), accompanied by some dichlorodimethyl-benzophenone, m.p. 70°, whose structure was not detd. —  $\bar{C}$  with fumaryl (di)chloride (3:5875) + AlCl<sub>3</sub>

in  $\text{CS}_2$  at 50–60° for 2 hrs. gives (25% yield {103}) bis-1,2-(2-chloro-5-methylbenzoyl)-ethylene, pale yel. cryst. from alc., m.p. 158° {103}.

[ $\bar{\text{C}}$  with benzoyl chloride +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives (50% yield {98}) {104} {105} 2-chloro-5-methylbenzophenone (6-chloro-3-methylbenzophenone) [Beil. VII-235], cryst. from  $\text{AcOH}$ , m.p. 35–36° {98} {104} {105}, together with 5-chloro-2-methyl-(3-chloro-6-methyl)-benzophenone [Beil. VII-235], oil, b.p. 210° at 30 mm. {106}. —  $\bar{\text{C}}$  with *o*-chlorobenzoyl chloride (3:6640) +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives {106} 5,2'-dichloro-2-methylbenzophenone [Beil. VII-235], oil, h.p. 225° at 12 mm. {106}.]

[ $\bar{\text{C}}$  with phthalic anhydride (1:0725) +  $\text{AlCl}_3$  gives (62.5% yield on the phthalic anhydride {107}) *o*-(2-chloro-5-methylbenzoyl)benzoic acid, ndls. from  $\text{C}_6\text{H}_6$ , m.p. 164–165° {107}, 165° {108}, which with conc.  $\text{H}_2\text{SO}_4$  at 75° for 4 hrs. {108} or with 8 pts. fuming  $\text{H}_2\text{SO}_4$  (20%  $\text{SO}_3$ ) {107} ring-closes to give (yields: 93% {107}, 85% {108}) 1-chloro-4-methyl-anthraquinone [Beil. VII-809, VII-421], yel. ndls. from  $\text{AcOH}$  or alc., m.p. 164° {107} {108}. — Note that the structure of the above keto acid, m.p. 164–165°, has been definitely established {109} as shown and that it is *not* the isomeric *o*-(5-chloro-2-methylbenzoyl)-benzoic acid, which appears to be still unreported. — For reactn. of  $\bar{\text{C}}$  with 3,6-dichlorophthalic anhydride (3:4860) {110} or with pyromellitic anhydride {111} in pres. of  $\text{AlCl}_3$  see indic. refs.]

[ $\bar{\text{C}}$  does *not* {112} react with bis-(chloromethyl) ether (3:5245), but  $\bar{\text{C}}$  with formalin + conc.  $\text{HCl}$  yields {62} 4-chloro-3-(chloromethyl)toluene since on reductn. with  $\text{Zn}$  +  $\text{NaOH}$  the prod. gives 4-chloro-1,3-dimethylbenzene (3:8665). —  $\bar{\text{C}}$  with aq. vapor +  $\text{CO}$  over suitable cat. at 300–400° yields {113} *p*-toluic acid (1:0795). —  $\bar{\text{C}}$  with  $\text{NH}_3$  +  $\text{CO}$  over suitable cat. as directed {114} yields *p*-toluidine (see also below). —  $\bar{\text{C}}$  with  $\text{S}_2\text{Cl}_2$  +  $\text{AlCl}_3$  in  $\text{CS}_2$  gives {115} 4,5-dichloro-1,8-dimethylthianthrene, m.p. 195–197° {115}.]

[ $\bar{\text{C}}$  with  $\text{Li}$  in ether gives (63% yield {116}) *p*-tolyllithium;  $\bar{\text{C}}$  with  $\text{Li}$  at 150° followed by treatment with aq. gives {117} toluene + 4,4'-dimethylbiphenyl. —  $\bar{\text{C}}$  with  $\text{Na}$  in  $\text{C}_6\text{H}_6$  treated with  $\text{CO}_2$  at ord. temp. {118} {119} or at 50° and 500 lbs. press. {120} cf. {121} gives (yields: 95% {120}, 76% {121}) *p*-toluic acid (1:0795), m.p. 178°. —  $\bar{\text{C}}$  with  $\text{Na}$  treated with benzophenone as directed {122} yields diphenyl-*p*-tolyl-carbinol [Beil. VI-722, VI-355], m.p. 72–73°.]

[ $\bar{\text{C}}$  on hydrolysis with aq. vapor over silica gel contg. 3% finely divided  $\text{Ni}$  at 380° {123}, or with aq. vapor over cat. at 480° {124}, or with aq.  $\text{Na}_2\text{CO}_3$  in pres. of  $\text{Cu}$  at 300° under press. {125}, or with 15–20% aq.  $\text{NaOH}$  at 300° {126} gives (80% yield {123}) *p*-cresol (1:1410). Note, however, claim {127} that  $\bar{\text{C}}$  when hydrolyzed with 15% aq.  $\text{NaOH}$  in pres. of  $\text{Cu}$  for 2 hrs. at 315–320° yields prod. contg. not only *p*-cresol (1:1410) but also *m*-cresol (1:1730) (for extensive study of hydrolysis of  $\bar{\text{C}}$  as means of prepn. of *m*-cresol see {147}). —  $\bar{\text{C}}$  with  $\text{H}_2\text{S}$  at 700° over suitable cat. yields {128} thio-*p*-cresol (*p*-tolyl-mercaptan).]

[ $\bar{\text{C}}$  with aq.  $\text{NH}_4\text{OH}$  +  $\text{CuO}$  at 150–250° under press. {129} or  $\bar{\text{C}}$  + aq.  $\text{NH}_4\text{OH}$  +  $\text{Cu}$  salts + various anti acids at 225–230° under press. {130} {131} yields *p*-toluidine and/or di-*p*-tolylamine. —  $\bar{\text{C}}$  with  $\text{KNH}_2$  in liq.  $\text{NH}_3$  {132} or  $\text{Na}$  in liq.  $\text{NH}_3$  {66} yields *p*-toluidine. — Note that  $\bar{\text{C}}$  does not react with aq. sodium sulfanilate +  $\text{Na}_2\text{CO}_3$  (dif. from benzyl chloride (3:8535) and use in sepn. of  $\bar{\text{C}}$  from latter {8}).]

[ $\bar{\text{C}}$  on mononitration yields a mixt. contg. both 4-chloro-2-nitrotoluene [Beil. V-327, V-162],  $V_2$ -251], m.p. 38.2° {133}, 37–38° {10}, 37° {29} {22}, h.p. 239.5–240° at 718 mm. {134}, 115.5° at 11 mm. {22} (easily volatile with steam, but not reacting with piperidine even after 8 hrs. at 100° {10}), and 4-chloro-3-nitrotoluene [Beil. V-329,  $V_2$ -252], m.p. 7° {135}, 5.8° {133}, b.p. 260° at 745 mm. {135}, 118° at 11 mm. {22} (reacts readily with piperidine at 100° {10}); e.g.,  $\bar{\text{C}}$  added in 2 equal portions to 3 wt. pts.  $\text{HNO}_3$  ( $D = 1.5$ ) at 0° gives 88% yield of mixt. contg. 58.8% 4-chloro-2-nitrotoluene + 41.2% 4-chloro-3-

3:8290 ETHYL  $\beta$ -CHLOROPROPIONATE

Beil. II - 250

 $\Pi_1 - (111)$ 

Π<sub>2</sub>-(227)

B.P. 162-163° at 765 mm. (1)

$$D_i^{20} = 1.1086 \quad (5) \quad D_0^{20} = 1.42537 \quad (5)$$

**162.5°** at 761 mm. (2)

1.1025 (18)	1.4269 (18)
-------------	-------------

162-163° at 760 mm. (3)

**162<sup>a</sup>** (4)

$$D_1^{15} = 1.1141 \quad (2) \quad n_D^{15} = 1.4284 \quad (2)$$

161.4–161.8° at 758 mm. (5)

161<sup>a</sup> (6)80<sup>a</sup> at 29 mm. (2)

61.5° at 15 mm. (7)

[For prepn. of  $\bar{C}$  from  $\beta$ -chloropropionic acid (3:0460) by esterification with EtOH + HCl (59% yield (6)) (4) or  $H_2SO_4$  (1) see indicated refs.; from  $\beta$ -chloropropionyl chloride (3:5690) + EtOH see (1); from acrylic acid chloride (3:7153) + EtOH see (4) (7); from ethyl acrylate (1:3071) + HCl see (2); from acrylonitrile + HCl to  $\beta$ -chloropropionitrile followed by reactn. with EtOH see (8); from ethyl lactate (1:3303) +  $SOCl_2$  + pyridine (95% yield (9)) see (9).]

(11) gives (90% yield (10)) ethyl acrylate (1:3071), b.p. 101°.

On reflux with NaI in acetone gives (yield: 81% (12), 75-80% (13)) ethyl  $\beta$ -iodopropionate, b.p. 183-185° at 760 mm. (13). [For study of rate of reactn. with KI in acetone see (6).] [Note also that  $\beta$ -iodopropionic acid with alc. HCl (as in its esterification) gives some ethyl  $\beta$ -chloropropionate (14).]

On catalytic hydrogenation as specified (7) takes up only a little  $H_2$  [dif. from ethyl  $\alpha$ -chloropropionate which gives quant. ethyl propionate].

[For reacts. of  $\bar{C}$  with  $CH_3MgI$  (15),  $C_2H_5MgBr$  (16), and other  $RMgX$  cpds. (17) see indicated refs.]

## 3:0730 CHLOROACETIC ACID ANHYDRIDE

 Beil. II - 199  
 II<sub>1</sub> - (89)  
 II<sub>7</sub> - (193)

M.P. 48-49° (16)	B.P. 163°	at 116 mm. (4)	$D_4^{50} = 1.3604$ (5)
46-47° (1)	161°	at 104 mm. (4)	$D_4^{20} = 1.5497$ (5)
46° (2)	149°	at 62 mm. (4)	
45.2° (3)	144°	at 51 mm. (4)	
	135°	at 36 mm. (4)	
	126-128°	at 30 mm. (5)	
	126°	at 24 mm. (4)	
	115-120°	at 20 mm. (6)	
	109-110°	at 10 mm. (2)	
	108-110°	at 10 mm. (16)	

Note that the above name of  $\bar{C}$  is so rendered to emphasize that it is the anhydride of chloroacetic acid (not a monochlorinated acetic anhydride).

Fr. from  $\text{C}_2\text{H}_5$ ; eas. sol. cold ether,  $\text{CHCl}_3$ ; spar. sol. cold  $\text{C}_6\text{H}_6$ ; insol. cold lgr.

[For prepn of  $\bar{C}$  from chloroacetic acid (3:1370) with  $\text{P}_2\text{O}_5$  in vac. (2), or with  $\text{Ac}_2\text{O}$  (5) (6) (in latter case note also formn. of mixed anhydride acetic-chloroacetic anhydride, b.p. 80-83° at 30 mm. (5), 80-85° at 20 mm. (3),  $D_4^{20} = 1.2003$  (5)), or with chloroacetyl chloride (3:5235) + an inorg acid chloride (7) or  $\text{AlCl}_3$  (8), see indic. refs.; for prepn. of  $\bar{C}$  from sodium chloroacetate with oxalyl (di)chloride (3:5060) in  $\text{C}_6\text{H}_6$  (54% yield) see (9); for prepn. of  $\bar{C}$  from chloroacetyl chloride (3:5235) with  $\text{Na}_2\text{CO}_3$  (4) or  $\text{KNO}_3$  (1) see indic. refs.]

$\bar{C}$  with aq  $\text{K}_2\text{CO}_3$  yields (2) polyglycolide (1:4976), m.p. 220°.

[For reactn. of  $\bar{C}$  with  $\text{AlCl}_3$  + toluene giving 46-59%  $\omega$ -chloro-*p*-methylacetophenone (3:1130) see (10); for reactn. of  $\bar{C}$  with  $\text{AlCl}_3$  + biphenyl giving 41% yield  $\omega$ -chloro-*p*-phenylacetophenone, pale yel ndls. from dil. alc, m.p. 122-123° see (11); for abnormal reactn. of  $\bar{C}$  with benzyl  $\text{MgCl}$  yielding  $\omega$ -chloro-*o*-methylacetophenone (3:9660) see (12).]

[For behavior of  $\bar{C}$  with various carbohydrates (13) and with cellulose (14) see indic. refs.]

$\bar{C}$  htd. 4 hrs. at 160-180° with phenyl isothiocyanate yields (15) after distn. at 14-20 mm. 2,4-dioxo-3-phenylthiazolidine [Beil. XXVII-238, XXVII<sub>1</sub>-(305)], m.p. 147-148° (15).]

$\bar{C}$  with aq hydrolyzes almost instantly yielding chloroacetic acid (3:1370). — For the amide, anilide, *p*-toluidide, and other derivs. corresp. to  $\bar{C}$  see chloroacetic acid (3:1370).

1

B.P. 163-164° at 751 mm. (1)

$$D_4^{70} = 0.987 \text{ (1)}$$

159-161° at 733 mm. (2)

[For prepn. of **5** from methyl-*n*-propyl-acetic acid (Beil. II<sub>1</sub>-(146)) (1) (2) with PCl<sub>3</sub> (1) or SOCl<sub>2</sub> (87% yield (2)) see indic. refs.]

[C with *n*-propyl zinc iodide in toluene gives (70% yield (2)) 6-methylnonanone-4, b.p. 192–193° at 715 mm. (2).]

On hydrolysis yields (1)  $\beta$ -methyl-*n*-caproic acid, [Bcil. II<sub>1</sub>-(146)] (1) (2), b.p. 215–216° (3), 212–213° at 755 mm. (1), 207–209° u.c. at 723 mm. (2).

Ⓐ *β*-Methyl-*n*-caproamide: m.p. 97° (1), 99° (4). [From **C** + excess conc. aq.  $\text{NH}_4\text{OH}$  (1)]

3:8365 (1) Dewael, Weckering, *Bull. soc. chim. Belg.* 33, 496-497 (1924). (2) Karrer, Shibata, Wettstein, Jacobowicz, *Helv. Chim. Acta* 13, 1302-1303 (1930). (3) Ciarnician, Silber, *Ber.* 46, 3080 (1913). (4) Bayer & Co., *Ger.* 228,667, Nov. 15, 1910; *Cent.* 1910, II 1789.

$D_4^{20} = 1.0884$ ,  $n_D^{20} = 1.4579$  (9); cf. behavior of stereoisomeric ethyl  $\beta$ -chlorocrotonate (3:8538).]

$\bar{C}$  with hydrazine hydrate in abs. alc. splits out HCl and EtOH with consequent ring closure yielding (18) 5-methylpyrazolone-3 [Beil. XXIV-19, XXIV<sub>1</sub>-(189)], m.p. 215° (18); note that same prod. is also obtd. from methyl  $\beta$ -chloroisocrotonate (3:8028).

$\bar{C}$  (1 mole) with phenylhydrazine (1 mole) at 100° for 6-8 hrs. gives by ring closure mainly (4) 3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-20, XXIV<sub>1</sub>-(190)], pr. from aq., m.p. 127°, accompanied by small amts. of 4-benzeneazo-3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-328, XXIV<sub>1</sub>-(319)], m.p. 155-156°, and 3,3'-dimethyl-1,1'-diphenyl-bis pyrazolone-5,5' [Beil. XXVI-484], dec. at high temp. without melting. — Note that with excess phenylhydrazine (2-4 moles) only traces of the 3-methyl-1-phenylpyrazolone-5 are formed while the amt. of the other two (less desirable) prods. is greatly increased (4).

### 3:8335 4-CHLORO-2-METHYLBUTANOL-2

( $\beta$ -Chloroethyl-dimethyl-carbinol)

$C_6H_{11}OCl$

Beil. I - 390

I<sub>1</sub>—  
I<sub>2</sub>-(424)

B.P. 166° (1)

72° at 13 mm. (2)

62-63° at 14 mm. (3)

[For prepn. of  $\bar{C}$  from methyl  $\beta$ -chloropropionate (3:5765) (3) or from ethyl  $\beta$ -chloropropionate (3:8290) (1) (53% yield (2)) with MeMgBr see indic. refs.]

$\bar{C}$  with fuming HCl at room temp. yields (1) 2,4-dichloro-2-methylbutane (3:8105).

$\bar{C}$  mixed with 3 pts. dry powdered KOH and htd. at 130-180° gives (43% yield (2)) by loss of HCl and ring closure 2,4-epoxy-2-methylbutane ( $\alpha,\alpha$ -dimethyltrimethylene oxide), b.p. 71° at 750 mm.,  $D_4^{20} = 0.8279$  (2).

$\bar{C}$  with specially dried K phthalimide htd. in a s.t. 8 hrs. at 169°, finally 3½ hrs. at 218°, yields (3) (by metathesis and loss of H<sub>2</sub>O) *N*-(2-methylbuten-2-yl-4)phthalimide, m.p. 99° (3).

3:8335 (1) Henry, *Bull. soc. chim. Belg.* 20, 152-156 (1906); *Cent.* 1906, II 1178; *Compt. rend.* 142, 133 (1906). (2) Bennett, Philip, *J. Chem. Soc.* 1928, 1938. (3) Späth, Spitzky, *Ber.* 59, 2276-2277 (1925).

3:8325 ETHYL  $\beta$ -CHLOROISOCROTONATE

Beil. II - 417

 $\Pi_1$ -(190) $\Pi_2$ -(397)

B.P.	B.P. (contd)			
165.6-167.2°	(1)	60° at 15 mm.	(7)	$D_4^{20} = 1.088$ (8)
164°	(13)	56-57° at 13 mm.	(8) (9)	1.087 (7)
161.4°	(2)	54° at 14 mm.	(10)	1.086 (11)
159-161°	(3)	50° at 10 mm.	(11)	$n_D^{20} = 1.4538$ (7)
157-158° at 740 mm.	(4)			$D_4^{18.7} = 1.0924$ (3)
155-156°	(5)			$n_D^{18.7} = 1.45423$ (3)
154-157°	(6)			$D_4^{17.7} = 1.0896$ (8)
				$n_D^{17.7} = 1.45467$ (8)
				$D_4^{14.4} = 1.0920$ (11)

[See also ethyl  $\beta$ -chlorocrotonate (3:8538).]

Note the lack of accord regarding the b.p. of  $\bar{C}$  especially at ordinary pressures; this is presumably attributable to more or less contamination with the stereoisomeric ester (3:8538).

[For prepn. of  $\bar{C}$  from  $\beta$ -chloroisocrotonic acid (3:1300) in EtOH with dry HCl gas (yields: 100% (4), 65% (12)) (2) (5) or a little conc.  $\text{H}_2\text{SO}_4$  (yield 65% (6)) (8) (11) see indic. refs.]

[For prepn. of  $\bar{C}$  from ethyl acetoacetate (1:1710) with  $\text{PCl}_5$  in  $\text{C}_6\text{H}_6$  followed by refluxing with a little  $\text{I}_2$  see (13) (1); note, however, that this method has subsequently (6) been regarded as unsatisfactory for the prepn. of pure  $\bar{C}$  although it suffices to give (40-50% yields (14)) a mixt. of  $\bar{C}$  with its stereoisomer (3:8538) which for many purposes is adequate.]

[ $\bar{C}$  (2 moles) with  $\text{K}_2\text{S}$  ( $1\frac{1}{2}$  moles) in 5 vols. abs. EtOH refluxed for 5 hrs. (note that the stereoisomer (3:8538) requires 16) gives (53% yield (14)) diethyl  $\beta, \beta'$ -thiodicrotonate,  $\text{S}(-\text{C}(\text{CH}_3)=\text{CH}.\text{COOC}_2\text{H}_5)_2$ , h.p. 150-153° at 4 mm. (14), accompanied by some ethyl  $\beta$ -mercaptocrotonate (see below).]

[ $\bar{C}$  with alc. NaSH as directed gives (55-60% yield crude prod. (15)) ethyl  $\beta$ -mercaptocrotonate, note that this prod. is apparently a mixt. of the two geom. stereoisomeric thioenols together with the keto form, viz., ethyl thioacetoacetate,  $\text{CH}_3\text{CS}.\text{CH}_2.\text{COOC}_2\text{H}_5$ ; for details see (15); note also that ethyl  $\beta$ -chlorocrotonate (3:8538) by the same treatment gives the same result so that a mixt. of the esters can be employed as initial material.]

[ $\bar{C}$  with alkali derivs. of alcohols, phenols, mercaptans, etc., splits out alkali halide yielding corresp. ethyl  $\beta$ -substituted crotonates: e.g.,  $\bar{C}$  with NaOEt in ether gives (5) ethyl  $\beta$ -ethoxycrotonate [Beil. III-373, III<sub>1</sub>-(135), III<sub>2</sub>-(254)], m.p. 29.5° (5);  $\bar{C}$  with Na allylate gives (6) ethyl  $\beta$ -allyloxycrotonate;  $\bar{C}$  with Na cinnamylate gives (6) ethyl  $\beta$ -cinnamylloxycrotonate;  $\bar{C}$  with Na phenolate gives (16) ethyl  $\beta$ -phenoxyacrylate, h.p. 152° at 18 mm. (16); note that in the three preceding cases either  $\bar{C}$  or its stereoisomer (3:8538) yields the same result.]

[ $\bar{C}$  with Na salt of ethyl mercaptan gives (12) ethyl  $\beta$ -ethylmercaptacisocrotonate, h.p. 127-129° at 16 mm. (12);  $\bar{C}$  with Na salt of benzyl mercaptan gives (75% yield (12)) a mixt. of ethyl  $\beta$ -benzylmercaptocrotonate, m.p. 64.5° (12), and ethyl  $\beta$ -benzylmercaptacisocrotonate (const. not given).]

[ $\bar{C}$  with diethyl sodiomalonate gives (9) cf. (17) *cis* diethyl  $\alpha$ -carbethoxy- $\beta$ -methylglutamate,  $(\text{C}_2\text{H}_5\text{OOC})_2\text{CH}.\text{C}(\text{CH}_3)=\text{CH}.\text{COOC}_2\text{H}_5$  [Beil. II-553], h.p. 164-165° at 12 mm.,

## CHAPTER XIX.

### DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

#### Section 2. $D_4^{20}$ less than 1.1500

(3:8500-3:8999)

3:8500	<i>d,l</i> -1-CHLOROPENTANOL-3 ( $\beta$ -Chloroethyl-ethyl-carbinol)	$\begin{array}{c} \text{C}_6\text{H}_{11}\text{OCl} \\ \text{CH}_3\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{Cl} \end{array}$	Beil. I — I <sub>1</sub> -(194) I <sub>2</sub> -(421)
B.P. 173°	at 760 mm. (1)	$D_4^{25} = 1.0327$ (2)	$n_D^{25} = 1.466$ (3)
100°	at 60 mm. (1)	1.035 (3)	1.448 (2)
77.0-77.5°	at 20 mm. (2)		
70-71°	at 10 mm. (3)		

Liquid with weak odor resembling that of allyl alcohol. — Sparingly sol. cold aq.; sol. hot aq.

[For prepn. of  $\bar{C}$  from  $\beta$ -chloropropionat . . . . .]

[ $\bar{C}$  with AcCl yields (1) 3-acetoxy-1-chl

4 hrs. at 160-170° with KOAc yields (4) 1-

$\bar{C}$  with BzCl yields (1) 3-benzyloxy-1-chloropentane, b.p. 168° at 15 mm. (1), while C htd. to 180° for 10 hrs. with NaOBz + KI yields (4) 1-benzoxypentanol-3, b.p. 181° at 20 mm., 171° at 11 mm. (4).]

[For reactn. of  $\bar{C}$  with alk.  $\text{Na}_3\text{AsO}_3$  see (3).]

[ $\bar{C}$  with  $\text{COCl}_2$  yields (5) the corresp. chloroformate, b.p. 95° at 18 mm., which with excess  $\text{NH}_3$  gives  $\beta$ -chloroethyl-ethyl-carbinyl carbamate, m.p. 68° (5).]

3:8380 *d,l*-1,2-DICHLOROHEXANE

 $C_6H_{12}Cl_2$ 

Beil. I - 144

I<sub>1</sub>—I<sub>2</sub>—

B.P. 172-174° (1)

 $D_{15}^{15} = 1.085$  (1)

[For prepn. of  $\bar{C}$  from hexene-1 (1:8255) +  $Cl_2$  see (1).]

3:8380 (1) Brochet, *Bull. soc. chim.* (3) 7, 569 (1892).

M.P. 47° (1) B.P. 130-131° at 11 mm. (1)  
45-46° (1) 128-130° at 9 mm. (1)  
40-42° (2)

Cryst. with agreeable camphoraceous odor from MeOH or EtOH. — Eas. sol. MeOH,  $C_6H_6$ , toluene, or pct. ether; spar. sol. in abs. alc. below 0°.

$\bar{C}$  slowly sublimes but on attempted distn. at ord. press. decomposes at about 240°.

[For prepn. of  $\bar{C}$  from chloral (3:5210), chloral hydrate (3:1270), or metachloral with  $ClSO_3H$  or  $FSO_3H$  at not above 50-60° see (1); note that from chloral (3:5210) with  $ClSO_3H$  at -50° for 10-12 hrs. yield of  $\bar{C}$  may be as high as 50%; from metachloral with  $ClSO_3H$  at 50° for a few hrs. yield is 60% (1); note also that various other products including chloralide (3:3510) are also formed. — For farmn. of  $\bar{C}$  from trichloroethylene (3:5170) with excess  $Cl_2O$  in  $CCl_4$  at -20° (2), or perhaps from  $\alpha,\alpha'$ -dichlorodiethyl ether (3:7595) with  $Cl_2$  in sunlight (3), see indic. refs.]

$\bar{C}$  on htg. in pres. of air gives (2) phosgene (3:5000).

$\bar{C}$  on reduction with conc. HI ( $D = 1.78$ ) in hailg. AcOH quantitatively yields (2) ethane.

$\bar{C}$  is fairly stable toward hailg. aq. or aq. alkalies (1).

$\bar{C}$  is claimed (1) to react with 2 moles of  $RMgX$  cpds. of either aliphatic or aromatic types, but no details are reported.

3:0738 (1) Fuchs, Katscher, *Ber.* 62, 2381-2386 (1929). (2) Goldschmidt, Schussler, *Ber.* 58, 569-570 (1925). (3) Roth, *Ber.* 8, 1017-1018 (1875).

M.P. 47° (1) B.P. 110-111° at 11 mm. (2).  
46-48° (2)

White cryst. (from pct. ether) (1); hygroscopic scales (from lgr.) (2). — Eas. deliquesces absorbing  $\frac{1}{2}$  mole  $H_2O$ . — Eas. sol. aq. but insol. almost all org. solvents except cold pct. ether or cold lgr.

[For prepn. from catechol (1,2-dihydroxybenzene) (1:1520) by action of  $SO_2Cl_2$  in ether at 0° see (1) (2); for prepn. from *o*-benzoquinone [Beil. VII-600] by action of ethereal HCl see (2); 4-chlorocatechol (3:2470) is also a by-product of both methods.]

[ $\bar{C}$  on oxido. with  $PhO_2$  in pct. ether gives (12% yield (2)) 3-chloro-*o*-benzoquinone [Beil. VII<sub>1</sub>-(388)]; for use in prepn. of  $\alpha$ -chlorophenazine see (1).]

$\bar{C}$  with  $FeCl_3$  gives a blue-green color, changing to clear red on addn. of  $Na_2CO_3$  (2).

③ 3-Chloropyrocatechol dibenzoate: ndls. from alc., m.p. 108-109° (2); 109° u.c. (1).

3:0745 (1) Wrede, Mühlroth, *Ber.* 63, 1932-1933 (1930). (2) Willstätter, Müller, *Ber.* 44, 2184-2189 (1911).

3:8515 FUROYL CHLORIDE  
(Pyromucyl chloride;  
furan 2-carboxylic  
acid chloride)

 $C_5H_3O_2Cl$ 

Beil. XVIII-276  
XVIII<sub>1</sub>—

B.P. 173-174° (1)  
173° (2) (3)  
170° (4)  
58° at 12 mm. (5)  
66° at 10 mm. (6)  
59.5-61.5° at 7 mm. (7)

M.P. -2° (8)

Colorless strongly refractive liquid rapidly decomposed in strong light (7).— $\bar{C}$  is stronger lachrymator than  $BzCl$  (2).

[For prepn. of  $\bar{C}$  from furoic acid (1:0475) with  $PCl_5$  (poor yields (3) (4) (6)), with excess  $PCl_5$  in dry  $CHCl_3$  as specified (100% yield (6)) (8), with  $PCl_5$  (77% yield (5)), with  $SOCl_2$  (100% (2), 79% (1), 60% (3)), with  $SOCl_2$  in  $C_6H_6$  (89.5% yield (7)), or with phosgene (9) see indic. refs.]

[ $\bar{C}$  with  $MeOH$  yields methyl furoate (1:3452), b.p. 180.5° at 750 mm., 76° at 20 mm.,  $D_4^{20} = 1.1792$ ,  $n_D^{20} = 1.4575$  (10);  $\bar{C}$  with  $EtOH$  yields ethyl furoate (1:2082), b.p. 197°, m.p. 34°;  $\bar{C}$  with furfuryl alc. (1:6425) yields (11) furfuryl furoate, dimorphous cryst., m.p. 27.5° and 19.5°, b.p. 122° at 2 mm. (11); for study of reactn. of  $\bar{C}$  with cellulose see (12)]

[ $\bar{C}$  with phenol yields (2) phenyl furoate, m.p. 41.5° (2)]

[ $\bar{C}$  with  $C_6H_6 + AlCl_3$  yields (13) (14)  $\alpha$ -furyl phenyl ketone [Beil. XVII-348; XVII<sub>1</sub>-(186)], b.p. 282-284°;  $\bar{C}$  with toluene +  $AlCl_3$  gives (80% yield (15))  $\alpha$ -furyl p-tolyl ketone, m.p. 41-42°, b.p. 180-183° at 23 mm. (15)]

[For study of reactn. of  $\bar{C}$  with  $Cl_2$  (16) or  $Br_2$  (17) see indic. refs.]

$\bar{C}$  with pyridine in ether or  $\bar{C}$  with  $Na$  or  $Ag$  furoate yields (18) furoic anhydride, ndls. from alc., m.p. 73° (18).

$\bar{C}$  on hydrolysis (rate of reactn. even with boilg. aq. slower than  $BzCl$  (6)) yields furoic acid (1:0475), m.p. 133-134° (for the amide, anilide, p-toluidide, and other derivatives corresp. to  $\bar{C}$  see 1:0475).

[For prepn. of  $\bar{C}$  from heptanoic acid (enanthic acid) (1:1140) with  $\text{PCl}_5$  (2) (51% yield (8)), with  $\text{PCl}_3$  (75% yield (1)), with  $\text{PCl}_3 + \text{ZnCl}_2$  (89% yield (8)), or with  $\text{SOCl}_2$  (yield 98.5% (6), 80% (8)) see indic. refs.]

[For reactn. of  $\bar{C}$  with various higher alcohols see (9), with various acylureas see (10), with vanillylamine see (11) (5), with sodium  $n$ -heptylate to yield  $n$ -heptylic anhydride (1:1165), b.p. 258°, see (1) (2).]

[ $\bar{C}$  with  $\text{AlCl}_3 + \text{phenol}$  yields (12) 48%  $o$ -( $n$ -heptanoyl)phenol, b.p. 172-174° at 20 mm. (13), 155-156° at 10 mm. (12), m.p. 24° (13), +9.8° (12),  $D_4^{24} = 1.0110$  (12),  $n_D^{25.5} = 1.5209$  (12) (phenylhydrazone, m.p. 91-92° (13), semicarbazone, m.p. 162° (12)), and 41%  $p$ -( $n$ -heptanoyl)phenol, m.p. 93-94° (13), 91-91.5° (12), b.p. 220° at 15 mm. (13) (acetate, m.p. 46.5° (12), benzoate, m.p. 96.5-97° (12), 92-93° (13)).]

[ $\bar{C}$  on warming with  $\text{NaN}_3$  in  $\text{C}_6\text{H}_6$  yields (14)  $n$ -hexyl isocyanate, b.p. 163-164° (14), and/or (15)  $n$ -hexylamine  $\text{HCl} + N,N'$ -di- $n$ -hexylurea, m.p. 58-59° (15).]

[ $\bar{C}$  in ether treated with diazomethane as directed (7) yields 1-chlorooctanone-2, b.p. 91-96° at 10 mm. (7).]

$\bar{C}$  on hydrolysis yields  $n$ -heptanoic (enanthic) acid (1:1140) q.v. (for the amine, amide,  $p$ -toluidide, and other derivatives corresp. to  $\bar{C}$  see 1:1140).

### PREPARATION OF $\bar{C}$

From benzene. The prepn. of  $\bar{C}$  from benzene (1:7400) by direct introduction of the  $-\text{CH}_2\text{Cl}$  group (chloromethylation) has been much studied especially in recent years. Chloromethylation may be effected with paraformaldehyde (1:0080), formalin (1:0145), chloromethyl methyl ether (3:7085), or bis-(chloromethyl) ether (3:5245), each in the pres. of  $\text{ZnCl}_2$  and frequently also of  $\text{HCl}$  gas. For a general review of the process of chloromethylation see (39) and subsequent articles (32) (40) (41). Various by-products of the reaction are formed, notably  $\omega, \omega'$ -dichloro-*p*-xylene (3:2825) and diphenylmethane (1:7120). For study of further chloromethylation of  $\bar{C}$  to various poly-(chloromethyl)-benzenes see (41).

[For prepn. of  $\bar{C}$  from  $\text{C}_6\text{H}_6$  (1:7400) by chloromethylation with paraformaldehyde (1:0080) +  $\text{ZnCl}_2$  +  $\text{HCl}$  (yields: 80% (42), 73.5% (40), 70% (32), 36% (42)) (39), with formalin (1:0145) +  $\text{ZnCl}_2$  +  $\text{HCl}$  (yields: 70.5% (40), 57% (44)) (45) (39) (48), or with chloromethyl methyl ether (3:7085) (40) (43) (46) (47) or bis-(chloromethyl) ether (3:5245) (40) (43) see indic. refs.]

From toluene. [For prepn. of  $\bar{C}$  from toluene (1:7405) by chlorination with  $\text{SO}_2\text{Cl}_2$  in pres. of dibenzoyl peroxide (75–80% yield (15)), with  $\text{SO}_2\text{Cl}_2$  (for study of effect of catalysts see (83) (84)) below 130° (49) (50), with  $\text{SO}_2\text{Cl}_2$  in pres. of acetyl chloride (51), with  $\text{Cl}_2$  (52) (53) (for study of catalysts see (85)) in vapor phase (54) (55) (61) in light (56) (57) (58) (59) (60) (62), with  $\text{Cl}_2$  in pres. of  $\text{Pb} + \text{PCl}_3$  (63), with  $\text{NOCl}$  at 150° (64) or 350° (65), with  $\text{NCl}_3$  (66), or with *ter*-butyl hypochlorite (3:7165) (62% yield (67)) see indic. refs.]

From benzyl alcohol. [For prepn. of  $\bar{C}$  from benzyl alcohol (1:6480) with  $\text{HCl}$  gas (68), with conc. aq.  $\text{HCl}$  at 60° (70–100% yield (69)) (70) in  $\text{C}_6\text{H}_6$  (study of kinetics at 60° (71)), with conc.  $\text{HCl} + \text{ZnCl}_2$  in cold (100% yield (72)), with  $\text{PCl}_3 + \text{ZnCl}_2$  (60% yield (72)), with  $\text{SOCl}_2$  (100% yield (73)) in  $\text{C}_6\text{H}_6$  (85% yield (72)) or in *N,N*-dimethylaniline (26% yield (72)), or with  $\text{AlCl}_3$  in pet. eth. above 40° (74) see indic. refs.]

From other miscellaneous sources. [For formn. of  $\bar{C}$  from benzyl chloroformate (3:9565) on bkg. (75) (76), from benzyl benzoate (1:4422) with 5 moles  $\text{SO}_2\text{Cl}_2$  (77), from dibenzyl ether (1:7640) or other benzyl ethers with  $\text{PCl}_3$  (78), from dibenzyl disulfide with excess  $\text{SO}_2\text{Cl}_2$  in  $\text{C}_6\text{H}_6$  at 37–39° (79), from benzylamine with  $\text{NOCl}$  in ether at  $-15^\circ$  (80) or with *aqua regia* (81), or from tetrabenzylhydrazine with conc.  $\text{HCl}$  on bkg. (82) see indic. refs.]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Determination of  $\bar{C}$ . Many methods for detn. of  $\bar{C}$  have been employed and no complete listing can be given here; the following examples, however, may be helpful. [For detn. of  $\bar{C}$  by boilg. with alc.  $\text{AgNO}_3$  and weighing pptd.  $\text{AgCl}$  see (85) cf. (83); for detn. of  $\bar{C}$  in

$C_6H_6$  by addn. of excess standard  $AgNO_3$  in isopropyl alc., btg. several hrs., and excess  $AgNO_3$  titrated with standard aq.  $NaCl$  see (71); for methods of detn. of  $\bar{C}$  in pres. of benzal (di)chloride (3:6327) or benzotrichloride (3:6540) see (86) (87).]

Pyrolysis of  $\bar{C}$ . [ $\bar{C}$  on hoiling (34) (88) gradually dec. with evoln. of  $HCl$ . —  $\bar{C}$  over glowing Pt wire gives (89) (90) much stilbene (1:7250) accompanied (91) by small amounts of toluene (1:7405) and dibenzyl (1:7149).]

Resinification of  $\bar{C}$ .  $\bar{C}$  under the influence of various catalysts condenses with itself evolving  $HCl$  and yielding a material of composition  $(C_7H_6)_n$ ; this material is often (though incorrectly) designated as polymeric  $\bar{C}$ . Because of the indefinite character of the product and the voluminous and diffuse character of the literature, no exhaustive review will here be attempted. However, for extensive reviews of this reaction see (92) (93); for studies of catalysts for this type of reaction see also (94) (95) (96) (97).

Reduction of  $\bar{C}$ . [ $\bar{C}$  with  $H_2$  in pres. of  $Pd/BaCO_3$  (98) or  $Ni$  (99) in alc.  $KOH$  loses all its halogen as  $HCl$  (use in quant. detn.), but the corresp. org. reduction prod. has not been characterized. —  $\bar{C}$  with  $H_2$  in pres. of colloidal  $Pd$  in alc. gives (76% yield (100)) toluene (1:7405). —  $\bar{C}$  with  $EtOH + Zn$  dust on boilg. gives (101) cf. (102) toluene (1:7405) + benzyl ethyl ether (1:7530). —  $\bar{C}$  in  $EtOH/KOH$  with hydrazine hydrate in pres. of  $Pd$  boiled for 1 hr. gives (29% yield (103)) dibenzyl (1:7149); note that in conc. soln. only traces of dibenzyl are formed (103) cf. (104) and the principal prod. is *N,N*-dibenzylhydrazine [Beil. XV-533, XV<sub>1</sub>-(164)] accompanied by some benzyl ethyl ether (1:7530).]

Oxidation of  $\bar{C}$ .  $\bar{C}$  upon oxidn. yields either benzoic acid or benzaldehyde according to circumstances.

[ $\bar{C}$  with air at 160° over  $Ni$  cat. (105), with  $O_2$  in u.v. light (106), or with  $CrO_3/H_2SO_4$  at 95–98° for 1½ hrs. (note that  $\beta$ -chloroethylbenzene (3:8712) is stable under these conditions (107)) cf. (53), gives benzoic acid (1:0715). —  $\bar{C}$  with conc. aq. alk. nt 250–280° and at 300–500 lh./sq. in. press. gives (80–90% yield (108)) benzoic acid (1:0715).]

[ $\bar{C}$  with equimolal amt.  $SeO_2$  refluxed without solv. for 3 hrs. (109), with  $CrO_2Cl_2$  followed by aq. (110), with bot very dil.  $HNO_3$  (111) (112), with hot 14% aq.  $Ph(NO_2)_2$  (111), with boilg. aq.  $Ca(NO_3)_2$  (112), with boilg. aq.  $Na_2Cr_2O_7 + Na_2CO_3$  (113), with boilg. aq. or alc. hexamethylenetetramine (114) (115), with air at 160° over  $Ni$  cat. (105), or with steam + air at 360–480° over  $V_2O_5$  on pumice (116) (117) gives benzaldehyde (1:0195); naturally any over-oxidn. gives also some benzoic acid (1:0715).]

[Note that auto-ignition temp. of  $\bar{C}$  on  $Pt$  in air at ord. press. is 627° (118).]

Substitution of  $\bar{C}$ . Chlorination [ $\bar{C}$  with  $NOCl$  at 150° gives (64) benzal (di)chloride (3:6327). —  $\bar{C}$  with aq.  $PhCl_2 \cdot 2NH_4Cl$  on boilg. gives (119) benzal (di)chloride (3:6327) + benzotrichloride (3:6540). —  $\bar{C}$  with  $Cl_2$  in pres. of  $I_2$  at 30–40° gives (120) cf. (121) both *o*-chlorobenzyl chloride (3:6400) and *p*-chlorobenzyl chloride (3:0220). — Note that  $\bar{C}$  with  $Cl_2$  in sunlight (122) undergoes both substitution and addition and that only isolatable prod. was benzal (di)chloride hexachloride, m.p. 153°.]

Bromination. [ $\bar{C}$  with  $Br_2$  at 100° gives (123) cf. (124) a mixt. of benzyl bromide, benzal chlorobromide, and benzal (di) bromide. —  $\bar{C}$  with  $Br_2 + BeBr_2$  in ether gives (125) *p*-bromobenzyl bromide. —  $\bar{C}$  with  $Br_2$  in pres. of  $I_2$  gives (126) (127) a mixt. of *p*-bromobenzyl bromide and *p*-bromobenzyl chloride.]

Sulfonation. [Presumably because of facile hydrolysis or resinification of  $\bar{C}$  with conc.  $H_2SO_4$ , its direct sulfonation has not been reported. However, *p*-sulfobenzyl chloride ( $\omega$ -chlorotoluene-*p*-sulfonic acid) [Beil. XI<sub>1</sub>-(30)] has been prepd. (e.g., (128) (129)) from sodium salt of *p*-toluenesulfonic acid by chlorination.]

Nitration.  $\bar{C}$  on mononitration gives a mixt. of *o*-nitrobenzyl chloride [Beil. V-327, V<sub>1</sub>-(162), V<sub>2</sub>-(252)], m.p. 49–50° (130), 49.5° (17), 48–48.5° (131), 48–49° (132), 47.9° (133) (143), *m*-nitrobenzyl chloride [Beil. V-329, V<sub>1</sub>-(163), V<sub>2</sub>-(252)], m.p. 45–46° (130),

45.5° (17) (131) (134), 44.9° (143), 44.8° (133), and *p*-nitrobenzyl chloride [Beil. V-329,  $V_1$ -(163),  $V_2$ -(253)], cryst. from alc., m.p. 72.5° (17) (131) (134), 72.4° (133), 71-72° (130), 71.95° (143), 71° (53). — [For earlier studies of this mononitration of  $\bar{C}$  see (53) (135) (136) (137) (138) (139) and especially (140). — Subsequent studies of this mononitration have been primarily concerned with the proportion of isomers; e.g.,  $\bar{C}$  on mononitration with conc.  $HNO_3$  in acetic anhydride gives (133) 40.9% *o*-, 4.2% *m*-, and 54.9% *p*-nitrobenzyl chlorides (cf. (141) (142) (144)). — For thermal anal. of various mixtures of these three nitrobenzyl chlorides see (133) (143). — For study of rate of nitration of  $\bar{C}$  in nitrobenzene soln. at 16-18° see (145). Note that *p*-nitrobenzyl chloride is a useful reagent for characterization of organic acids by conversion to the corresp. *p*-nitrobenzyl esters (146) (147); for transformation of *p*-nitrobenzyl chloride to *p*-nitrobenzyl bromide in alc. NaBr see (147) cf. (148)]

[Direct polynitration of  $\bar{C}$  has not been reported; however, *p*-nitrobenzyl chloride on further nitration with  $HNO_3/H_2SO_4$  as directed (149) (150) gives 2,4-dinitrobenzyl chloride [Beil. V-344,  $V_2$ -(263)], tbs. from ether, m.p. 34° (150), 33-34° (149). — No other dinitrobenzyl chlorides and no trinitrobenzyl chlorides have been reported]

Hydrolysis of  $\bar{C}$ .  $\bar{C}$  on hydrolysis by various means gives benzyl alcohol (1:6480) and HCl.

[ $\bar{C}$  with aq. on protracted boilg. (151) (86) in sunlight (154), with steam + cat. at 550-850° (155) cf. (156), with boilg. nq.  $K_2CO_3$  (157) or alk.-earth carbonates at elev. temps. (158) (159), with hot nq. suspension of PbO (111), with boilg. nq.  $Na_2CO_3$ , NaOH, or their mixt. (160) (161), or with anhydrous formic acid (162) gives benzyl alcohol (1:6480). — For studies on kinetics of hydrolysis of  $\bar{C}$  in aq. (163) (169), in 95% EtOH at 30° and 40° (164) (165), in 50% acetone at 60° (166) cf. (167) (168) (170) (17), in dioxane (22), or in formic acid (170) see indic. refs.]

#### BEHAVIOR OF $\bar{C}$ WITH OTHER INORGANIC REACTANTS

With alkali sulfhydrylates. [ $\bar{C}$  with alc. KSH (171) (172) or aq. NaSH (173) (174) (175) gives (75% yield (172)) benzyl mercaptan [Beil. VI-453,  $VI_1$ -(224),  $VI_2$ -(427)], b.p. 194-195° (171), 99° at 32 mm (176), 75.8-76.2° at 10 mm. (11),  $D_4^{25} = 0.8097$  (176),  $n_D^{25} = 1.5729$  (176) (corresp. benzoate, m.p. 30° (177), 3,5-dinitrobenzoate, m.p. 119-120° (177), reaction prod. with 3-nitrophthalic anhydride, m.p. 136-137° (177), 2,4-dinitrophenyl thioether, m.p. 182.5° cor. (185)). Note that benzyl mercaptan with isotopic sulfur has been prepared (178) from  $\bar{C}$  via conversion to  $RMgCl$  and reaction with  $S^{34}$ .]

With alkali sulfides. [ $\bar{C}$  with alc.  $K_2S$  (171) or alc.  $Na_2S$  (179) gives (83% yield (179)) dibenzyl sulfide [Beil. VI-455,  $VI_1$ -(225),  $VI_2$ -(429)], tbs. from ether,  $CHCl_3$ , or alc., m.p. 49-50° (180), 49° (171) (179) (181) (corresp. sulfoxide [Beil. VI-456,  $VI_1$ -(226),  $VI_2$ -(429)], m.p. 135° (182), 132-134.6° (183), 132-133° (179); corresp. sulfone [Beil. VI-456,  $VI_1$ -(226),  $VI_2$ -(430)], m.p. 151° (184), 149.5-151° (183), 149.5-150° (179).]

With alkali polysulfides. [ $\bar{C}$  with alc.  $Na_2S_9H_2O + S$  (186) (189) in  $C_6H_6$  (187) cf. (188) gives dibenzyl disulfide [Beil. VI-465,  $VI_1$ -(229),  $VI_2$ -(437)], m.p. 74° (189), 72° (190), 71-72° (191), 70° (186) (corresp. disulfoxide [Beil. VI-466,  $VI_1$ -(230),  $VI_2$ -(438)], m.p. 108° (190) (192) cf. (209) (201) (210)].]

With salts of various sulfur acids. [ $\bar{C}$  with conc. aq.  $K_2SO_4$  (194) cf. (196) or  $Na_2SO_4$  (195) in aq. alc. at 37° (197) (for study of rate at 40° see (16)) or at 190-200° under press. (98% yield (198)), or  $\bar{C}$  with aq.  $Na_2SO_4/NaOH$  on boilg. (80% yield (199)) (192), gives corresp. salt of toluene- $\alpha$ -sulfonic acid (benzylsulfonic acid) [Beil. XI-116,  $XI_1$ -(32)]; for dimorphism of Na salt see (200) (corresp. sulfonyl chloride, m.p. 92-93° (201) (202), 92° (203); corresp. amide, m.p. 105° (203) (192), 104-105° (199), 102° (204); corresp. methyl ester, m.p. 61-62° (205)].]

[ $\bar{C}$  with  $\text{Na}_2\text{S}_2\text{O}_3$  on boil. in aq. alc. (206) or aq. (207) gives salt of *S*-benzylthiosulfuric acid [Beil. VI-439, VI<sub>1</sub>-(230)] (corresp. quaternary salt, viz., benzyl-dimethyl-phenyl-ammonium *S*-benzylthiosulfate, from metathesis of benzyl-dimethyl-phenyl-ammonium chloride with sodium *S*-benzylthiosulfate, has m.p.  $104^\circ$  (208)).]

With salts of other inorganic acids. [ $\bar{C}$  with NaI in acetone (211) (212) or abs. MeOH (213), or  $\bar{C}$  with KI in acetone (214) or EtOH (215), gives (90% yield (211)) benzyl iodide [Beil. V-314, V<sub>1</sub>-(157), V<sub>2</sub>-(241)], m.p.  $24^\circ$  (211) (212),  $27-30^\circ$  (213), b.p.  $97-98^\circ$  at 11 mm. (216),  $93^\circ$  at 10 mm. (214). — For study of rate of reaction of  $\bar{C}$  with KI in acetone at  $25^\circ$  (19) (20),  $30^\circ$  (19), and  $50^\circ$  (19), or with NaI or LiI in acetone at  $25^\circ$  or  $30^\circ$  (19), see indic. refs.]

[ $\bar{C}$  with powdered  $\text{AgNO}_3$  in dry ether 20 hrs. in cold, then at  $70-75^\circ$  for 5 hrs., gives (84% yield (219)) (220) benzyl nitrate [Beil. VI-439], explosive liquid, b.p.  $106^\circ$  at 20 mm. (219),  $100-101^\circ$  at 18 mm. (21),  $43^\circ$  at 0.5 mm. (220). — For study of kinetics of reaction of  $\bar{C}$  with solid  $\text{AgNO}_3$  (221) in pres. of inert diluents such as dry ether,  $\text{CHCl}_3$ , and  $\text{CCl}_4$  (222) see indic. refs.; for study of kinetics of reaction of  $\bar{C}$  with  $\text{Hg}(\text{NO}_3)_2$  in aq. dioxane see (21).]

[ $\bar{C}$  with  $\text{AgNO}_2$  (223) (224) (231) or better mercurous nitrate (225) gives  $\omega$ -nitrotoluene (phenylnitromethane) [Beil. V-325, V<sub>1</sub>-(161), V<sub>2</sub>-(249)], b.p.  $225-227^\circ$  dec. (226) (227) cf. (228),  $141-142^\circ$  al. dec. at 35 mm. (226),  $135^\circ$  at 25 mm. (229),  $118-119^\circ$  at 16 mm. (230),  $110^\circ$  at 8 mm. (231),  $90-92^\circ$  at 3 mm. (232);  $D_4^{24.7} = 1.1540$  (233),  $D_D^{20} = 1.1598$  (226);  $n_D^{24.7} = 1.5285$  (233),  $n_D^{20} = 1.5323$  (226); note, however, that phenylnitromethane is best prepd. in a different way, viz., from benzyl cyanide with methyl nitrate and alc./NaOEt (50-55% yield (232)). — Note that the isomeric benzyl nitrite [Beil. VI-439], unstable oil, b.p.  $80-81^\circ$  at 35 mm. (234), has been reported from benzyl alcohol (1:6480) with aq.  $\text{NaNO}_2 + \text{H}_2\text{SO}_4$  (234).]

[ $\bar{C}$  with  $\text{NaN}_3$  in alc. refluxed 6 hrs. gives (90% yield (234))  $\omega$ -azidotoluene (benzyl azide) [Beil. V-350, V<sub>1</sub>-(174), V<sub>2</sub>-(274)], oil, insol. aq. and volatile with either steam or ether, b.p.  $108^\circ$  at 23 mm. (235),  $82.5^\circ$  at 16.5 mm. (234),  $74^\circ$  cor. at 11 mm. (236);  $D_4^{24.9} = 1.0655$  (237);  $n_D^{24.9} = 1.53414$  (237).]

[For behavior of  $\bar{C}$  with metallic cyanides see below under organic acids.]

With ammonia.  $\bar{C}$  with ammonia under various circumstances (see below) gives one (or more) of the following amines.

*Benzylamine* [Beil. XII-1013, XII<sub>1</sub>-(445)], liq. with faint characteristic odor, misc. with aq. alc. ether: b.p.  $184.5^\circ$  cor. at 760 mm. (238),  $184-186^\circ$  cor. at 745 mm. (239),  $184^\circ$  at 767 mm. (240),  $182^\circ$  at 749 mm. (226),  $181.5-182^\circ$  at 740 mm. (241),  $90^\circ$  at 12 mm. (242);  $D_4^{25} = 0.9812$  (243),  $D_4^{20} = 0.9822$  (244);  $n_D^{20} = 1.54015$  (226),  $n_D^{19.5} = 1.54406$  (244) (corresp.  $\bar{B}\cdot\text{HCl}$ , m.p.  $255.5-258^\circ$  (245),  $255-256^\circ$  rap. htg. (226),  $253^\circ$  (246);  $\bar{B}$   $\text{P}(\text{OH})_3$ , m.p.  $195-199^\circ$  (247),  $194^\circ$  (248);  $\bar{B}$ , 3,5-dinitrobenzoic acid, m.p.  $210.0^\circ$  cor. (249);  $\bar{B}$  2,4-dinitrobenzoic acid, m.p.  $199.1-200.1^\circ$  cor. (513);  $\bar{B}$ , *p*-toluenesulfonic acid, m.p.  $180.5-181.5^\circ$  u.c. (250),  $180^\circ$  (251)). — *Dibenzylamine* [Beil. XII-1035, XII<sub>1</sub>-(453)], oil, insol. aq., eas. sol. alc., ether; b.p.  $>300^\circ$  dec. (252),  $268-271^\circ$  cor. at 250 mm. (238),  $218-220^\circ$  at 60 mm. (253),  $215^\circ \pm 1^\circ$  at 39 mm. (254),  $186^\circ$  at 19 mm. (255),  $172^\circ$  at 14 mm. (256); f.p.  $-25.6^\circ$  (254);  $D_4^{25} = 1.024$  (255),  $1.019$  (257);  $D_4^{21.6} = 1.0256$  (244);  $n_D^{21.6} = 1.57432$  (244) (corresp.  $\bar{B}\cdot\text{HCl}$ , m.p.  $256^\circ$  (252),  $255.5^\circ$  (258);  $\bar{B}$ , *p*-toluenesulfonic acid, m.p.  $155.5-156.5^\circ$  u.c. (250)). — *Tribenzylamine* [Beil. XII-1038, XII<sub>1</sub>-(454)], solid, m.p.  $92^\circ$  (259) (260),  $91^\circ$  (256) (261) (262); b.p.  $218-222^\circ$  at 14 mm. (256),  $230^\circ$  at 13 mm. (259) (corresp.  $\bar{B}\cdot\text{HCl}$ , m.p.  $227-228^\circ$  (263),  $221^\circ$  (261);  $\bar{B}$ , *p*-toluenesulfonic acid, m.p.  $200.0-202.5^\circ$  u.c. (250)).

[For formn. of mixts. of benzylamine, dibenzylamine, and tribenzylamine (properties given in preceding paragraph) from reaction of  $\bar{C}$  with aq.  $\text{NH}_4\text{OH}$  at  $80^\circ$  for 8 days (264) or at  $125^\circ$  and 8 atm. press. (265) in pres. of cat. (266); from reaction of  $\bar{C}$  with alc.  $\text{NH}_3$  on

**3:0747 2-(CHLOROMETHYL)NAPHTHALENE**  
( $\beta$ -Naphthylmethyl chloride;

(1)  $D^{25}_D = 1.530$  (2)  $n^{25}_D = 1.5065$  (2)

48° (2)

105-107° at 13 mm. (1)

102° at 11 mm. (2)

[See also liquid diastereoisomer (3:0063).]

gives (yields: 92% (329), 85% (212)) benzylamine (for constants see above under behavior of  $\bar{C}$  with  $NH_3$ ) as hydrochloride;  $RMgCl$  with  $BrNH_2$  gives (63% yield (330)) benzylamine. —  $RMgCl$  with  $NCl_3$  gives (331) both benzylamine (32% yield) and dibenzylamine (7% yield). —  $RMgCl$  with  $SiF_4$  gives (336)  $(C_6H_5.CH_2)_3SiF$ , m.p.  $79^\circ$ , accompanied by some  $(C_6H_5.CH_2)_4Si$ , m.p.  $127.5^\circ$ ; the latter is also obtd. (20.7% yield (337)) from  $RMgCl$  with  $Na_2SiF_6$ .]

$RMgCl$  with organic reactants frequently (but not invariably) leads to products derived from *o*-tolyl  $MgCl$  and/or *p*-tolyl  $MgCl$ : for reviews on and studies of this rearr. of  $RMgCl$  see (332) (333) (334) (335). —  $RMgCl$  shows little if any tendency to act as a reducing agent in Grignard additions; for review of reducing action of many Grignard reagents (including  $C_6H_5.CH_2MgCl$ ) see (338).

[ $RMgCl$  with  $CO$  at  $120^\circ$  under press. gives (60% yield (339)) 1,3-diphenylpropene-1 [Beil. V-643,  $V_1$ -(310),  $V_2$ -(552)]. —  $RMgCl$  with  $CO_2$  gives (yields: 75–76% (310), 62.7% (335), 60% (340), 51% (318), 40% (333)) phenylacetic acid (1:0665).]

[ $RMgCl$  with trioxymethylene gives (50–55% yield (341)) (342) (343) *o*-tolylcarbinol (1:5922) (note rearr.), but  $RMgCl$  with nectaldehyde (as paraldehyde) gives (343) (335) the expected benzyl-methyl-carbinol [Beil. VI-503,  $VI_1$ -(251),  $VI_2$ -(472)]. —  $RMgCl$  with benzaldehyde gives according to conditions various prods. including benzyl-phenyl-carbinol (1:5958) (78% yield (344)) (345) (346), stilbene (1:7250) (25–35% yield (316)), and other products.]

[ $RMgBr$  with acetone gives (347) (343) benzyl-dimethyl-carbinol (1:5910). —  $RMgCl$  gives with diphenylketone (85% yield (349)) (348) benzyl-diphenyl-carbinol [Beil. VI-721,  $VI_1$ -(354),  $VI_2$ -(696)] easily dehydrated to (54–59% overall yield (316))  $\alpha,\alpha,\beta$ -triphenylethylene [Beil. V-722,  $V_1$ -(355),  $V_2$ -(630)].]

[ $RMgCl$  with  $ClCH_2OCH_3$  (3:7035) according to circumstances gives either or both the "normal" prod. (350) (351) methyl  $\beta$ -phenylethyl ether [Beil. VI-479,  $VI_1$ -(238),  $VI_2$ -(449)] and the "abnormal" prod. (352) (353) methyl *o*-tolylcarbinyl ether [Beil. VI-484]. —  $RMgCl$  with  $ClCH_2O.CH_2CH_3$  (3:7195) according to circumstances gives either or both the "normal" prod. (354) ethyl  $\beta$ -phenylethyl ether [Beil.  $VI_1$ -(450)] or the "abnormal" products (352) (352) ethyl *o*-tolyl ether [Beil. VI-484] and ethyl *p*-tolyl ether [Beil. VI-498].]

[ $RMgCl$  with methyl chloroformate (3:5075) gives some "abnormal" prod. (333). —  $RMgCl$  with ethyl chloroformate (3:7295) gives not only the "normal" tribenzylcarbinol [Beil. VI-723,  $VI_1$ -(356)] (355) and ethyl phenylacetate (1:3872) but also "abnormal" products (332) (333).]

[ $RMgCl$  with acetyl chloride (3:7065) gives (yields: 24% (333), 18% (335)) (332) the "abnormal" product, methyl *o*-tolyl ketone (*o*-methylacetophenone) (1:5224). —  $RMgCl$  with benzoyl chloride (3:6240) gives (333) the "abnormal" product, phenyl *o*-tolyl ketone [Beil. VII-439,  $VII_1$ -(234)].]

[ $RMgCl$  with benzenesulfonyl chloride gives (356) (357) benzyl phenyl sulfone [Beil. VI-455,  $VI_2$ -(428)] (2.9% yield (356)) cf. (357) and  $\bar{C}$  (60% yield (356))]

$RMgCl$  with alkyl *p*-toluenesulfonates gives hydrocarbons. — [E.g.,  $RMgCl$  with methyl *p*-toluenesulfonate gives (40.9% yield (358)) ethylbenzene (1:7410), with ethyl *p*-toluenesulfonate (358) or diethyl sulfate (359) gives (yields: 100% (359), 38.3% (358)) *n*-propylbenzene (1:7450), with *n*-propyl *p*-toluenesulfonate gives (35.6% yield (358)) *n*-butylbenzene (1:7515), with *n*-butyl *p*-toluenesulfonate gives (yields: 67% (361), 50–59% (360), 24.6% (358)) *n*-amylbenzene (1:7549). —  $RMgCl$  with  $\gamma$ -chloro-*n*-propyl *p*-toluenesulfonate gives (42–50% yield (362))  $\omega$ -chloro-*n*-butylbenzene ( $\delta$ -phenyl-*n*-butyl chloride) [Beil.  $V_1$ -(201),  $V_2$ -(317)].]

stdg. several days (268) (269) (270) or in s.t. at  $100^\circ$  (256) (267), with  $\text{NH}_3$  in conc. aq. phenol in s.t. at  $100^\circ$  for 18 hrs. (271), with liq.  $\text{NH}_3$  for 24 hrs. (256), or with 5 moles aq.  $(\text{NH}_4)_2\text{CO}_3$  for 5-6 hrs. at  $85-110^\circ$  (160) see indic. refs.]

[For formn. of benzylamine from reaction of  $\bar{\text{C}}$  with K phthalimide at  $170-180^\circ$  followed by hydrolysis of the *N*-benzylphthalimide (see below under  $\bar{\text{C}}$ 's) with fuming  $\text{HCl}$  at  $200^\circ$  for 2 hrs (272) cf. (273) (274), with silver cyanate followed by hydrolysis with alkali (275) (276) cf. (268) (277), with acetamide followed by hydrolysis with alc.  $\text{KOH}$  (278), or with hexamethylenetetramine followed by hydrolysis with alc.  $\text{HCl}$  (279) see indic. refs.]

[For formn. of tribenzylamine from reaction of  $\bar{\text{C}}$  with  $\text{NaNH}_2$  at  $120^\circ$  for 24 hrs. see (261) (280)]

With hydroxylamine.  $[\bar{\text{C}}$  with  $\text{NH}_2\text{OH} \cdot \text{HCl} + \text{Na}_2\text{CO}_3$  in aq. alc. under reflux gives (281) (282) (283) (284) *N,N*-dibenzylhydroxylamine [Beil. XV-19, XV<sub>1</sub>-(9)], m.p.  $124^\circ$  (284),  $123-124^\circ$  (285),  $123^\circ$  (281); note that the isomeric *O,N*-dibenzylhydroxylamine [Beil. XV-21], oil, b.p.  $145-146^\circ$  at 3 mm. (286), is obt'd. indirectly. —  $\bar{\text{C}}$  with acetone oxime refluxed in 75%  $\text{AcOH}$  gives (287) (as the hydrochloride) *N*-benzylhydroxylamine [Beil. XV-17, XV<sub>1</sub>-(8)], m.p.  $57^\circ$  (288),  $56-58^\circ$  (289) ( $\bar{\text{B}} \cdot \text{HCl}$ , m.p.  $110^\circ$  (288)). — Various other benzylated hydroxylamines cannot be discussed here.]

With hydrazine.  $[\bar{\text{C}}$  with alc. 50% hydrazine hydrate under reflux gives (290) *N,N*-dibenzylhydrazine [Beil. XV-533, XV<sub>1</sub>-(164)], m.p.  $65^\circ$  ( $\bar{\text{B}} \cdot \text{HCl}$ , m.p.  $202^\circ$  (292),  $200^\circ$  (290)); note that the isomeric *N',N'*-dibenzylhydrazine [Beil. XV-534, XV<sub>1</sub>-(166)], m.p.  $47^\circ$  (291) ( $\bar{\text{B}} \cdot \text{HCl}$ , m.p.  $225^\circ$  (293)), is prep'd. indirectly. — Various other benzylated hydrazines cannot be discussed here.]

With metals. Sodium  $[\bar{\text{C}}$  with  $\text{Na}$  at  $30^\circ$  on stdg. gives (294) encrustation of  $\text{NaCH}_2 \cdot \text{C}_6\text{H}_5$  [Beil. XVI<sub>1</sub>-(589)]; the solid is wine red within 5 hrs., red-violet in 12 hrs., blue-violet in 36 hrs., and finally blue-black; and the sodium benzyl can be isolated as a blue-violet solid stable in air (294) —  $\bar{\text{C}}$  with  $\text{Na}$  at  $100^\circ$  (295) in a mixt. of  $\text{C}_6\text{H}_6$  and toluene (296) or in toluene (297) gives dibenzyl (1:7149). —  $\bar{\text{C}}$  with  $\text{Na}$  in liq.  $\text{NH}_3$  loses its halogen quantitatively (298) giving (50% yield (299)) dibenzyl (1:7149) accompanied by toluene and other products. — For study of free benzyl radical from  $\bar{\text{C}}$  with  $\text{Na}$  vapor in helium see (302)]

$[\bar{\text{C}}$  with  $\text{Cu}$  powder in s.t. at  $150-160^\circ$  for 12 hrs (300), or  $\bar{\text{C}}$  with  $\text{Al}$  powder (pretreated with  $\text{H}_2$  at  $500^\circ$ ) refluxed at  $200^\circ$  for 1 hr (301), gives (60% yield (301)) dibenzyl (1:7149).]

Magnesium  $[\bar{\text{C}}$  as vapor passed over htd.  $\text{Mg}$  gives (303) magnesium allylide which with aq. yields methylacetylene ("allylene").]

$[\bar{\text{C}}$  with  $\text{Mg}$  in dry ether gives (304) (305) (306)  $\text{C}_6\text{H}_5 \cdot \text{CH}_2\text{MgCl}$ : for study of optimum conditions (311) giving yields of 94.25% (307), 93.2% (308), 91.0-94.1% (309), 90.7-91.2% (310) see indic. refs.; for study of effect of nature of  $\text{Mg}$  (312), of use of ether/hydrocarbon mixts. as solvent (313), of stability toward long holdg. in ether or ether/benzene (314) see indic. refs., for further examples of practical prepn. of  $\text{C}_6\text{H}_5 \cdot \text{CH}_2\text{MgCl}$  see (315) (316). — Note that some dibenzyl (1:7149) (e.g., 9.4% (317)) and di-*p*-tolyl (4,4'-dimethylbiphenyl) (318) are also formed and the yield of dibenzyl is greatly increased in pres. of cat. such as  $\text{CuCl}_2$ ,  $\text{HgBr}_2$ ,  $\text{FeCl}_3$ ,  $\text{FeBr}_3$  (319), or  $\text{MoCl}_5$  (320).]

An exhaustive treatment of the behavior of  $\text{C}_6\text{H}_5 \cdot \text{CH}_2\text{MgCl}$  (hereafter called  $\text{RMgCl}$ ) is far beyond the scope of this book, but the following examples will be useful and will serve as lead references; for further examples see Beil. XVI-939, XVI<sub>1</sub>-(554) and subsequent literature.

$[\text{RMgCl}$  with  $\text{O}_2$  gives (80% yield (321)) cf. (322) benzyl alcohol (1:6480). —  $\text{RMgCl}$  (1 mole) gives (84% yield (323)) (324) (325)  $\text{C}_6\text{H}_5 \cdot \text{CH}_2\text{HgCl}$ , m.p.  $104^\circ$  (323) (324) (326), but excess  $\text{RMgCl}$  with  $\text{HgCl}_2$  gives (326) (325) (327) dibenzyl mercury, m.p.  $111^\circ$  (326). —  $\text{RMgCl}$  with  $\text{SbCl}_5$  gives (328) tribenzylstilbene, m.p.  $107-108^\circ$ . —  $\text{RMgCl}$  with  $\text{ClNH}_2$

[ $\bar{C}$  with benzyl alc./ $\text{NaOCH}_2\text{C}_6\text{H}_5$  in ether (415), with solid KOH at 180–200° (416), with conc. aq. NaOH at 90–120° (416), or with K benzylate in liq.  $\text{NH}_3$  (408) gives dibenzyl ether (1:7640).]

With phenols (or phenolates).  $\bar{C}$  with phenols may react either with phenolic or nuclear hydrogen giving respectively benzyl aryl ethers or benzylated phenols; moreover, the former may, under appropriate conditions, be rearranged to the latter; examples of all these types of reaction are included below.

[ $\bar{C}$  with K phenolate (111) (418) or Na phenolate (417) in boilg. alc., or  $\bar{C}$  with phenol in boilg. alc. NaOMe or NaOEt (419) (420), boilg. aq. NaOH (160) (421), or boilg. acetone +  $\text{K}_2\text{CO}_3$  (422) gives (73% yield (421)) benzyl phenyl ether [Beil. VI-432,  $\text{VI}_1$ -(220),  $\text{VI}_2$ -(411)], m.p. 39° (418) (420) (421) (422), 38–39° (401); b.p. 286–287° (401), 286–288° (419), 178–179° at 35 mm. (422), 124–125° at 4 mm. (417). — Note that although this prod. is completely stable to distn. (419) yet on htg. with  $\text{ZnCl}_2$  or in dry HCl as directed (421) it undergoes rearr. (accompanied by some cleavage) giving 2-benzylphenol (1:1431), 4-benzylphenol (1:1485), 2,4-dibenzylphenol (see below), and other prods.]

$\bar{C}$  under suitable conditions also effects nuclear benzylation of phenol yielding a mixt. of *o*-benzylphenol (1:1431) and *p*-benzylphenol (1:1485) (the latter usually predominating) accompanied by polybenzylphenols and other products. [E.g.,  $\bar{C}$  with phenol (1:1420) directly at 125° (423) or 150–180° (160), or in pres. of Cu powder at 115–120° (160), Ce at 120–130° (424), Ti (393),  $\text{AlCl}_3$  in pet. ether (425), Zn at room temp. (426) (427) (428) (429) in solvent media such as  $\text{C}_6\text{H}_6$ , toluene,  $\text{CHCl}_3$ , or EtOH (430),  $\text{ZnCl}_2$  on warming (421) (431) (432), 38% HCl in s.t. at 100° (421),  $\text{P}_2\text{O}_5$  (434) or  $\text{PCl}_5$  (435) in toluene at 130–135°, or  $\bar{C}$  with Na phenolate (or phenol + Na) in dry toluene (419) (436) (437) gives *o*-benzylphenol + *p*-benzylphenol (accompanied by other products). — For sepn. of the two benzylphenols by formn. of Na salt of latter in toluene see (438).]

Other phenols, cresols, naphthols, etc., behave analogously but cannot be discussed here.

With phenol ethers. With phenol ethers (where no phenolic H atom is available for reaction)  $\bar{C}$  effects nuclear benzylation. [E.g.,  $\bar{C}$  with methyl phenyl ether (anisole) (1:7445) refluxed 2–3 hrs. (391), or in pres. of Zn (439), Ti (393), Ce (424), W (365),  $\text{AlCl}_3$  (440), or  $\text{ZnCl}_2$  + dry HCl (421) gives (yields: 63% (393), 57% (424), 52.9% (365)) *p*-benzylanisole [Beil. VI-676,  $\text{VI}_1$ -(325),  $\text{VI}_2$ -(630)], b.p. 305–308° (425), 191–193° at 38 mm. (391), 172–174° at 10 mm. (421), 157–158° at 8 mm. (411), 133–135° at 4 mm. (425); m.p. 20–21° (441).]

[ $\bar{C}$  with phenetole (1:7485) in pres. of Ti (393), U (365), or Ce (424) as directed gives (yields: 76% (393), 80% (365), 88% (424)) *p*-benzylphenetole [Beil. VI-676,  $\text{VI}_2$ -(630)], b.p. 317° (442), 315–317° (425), 217° at 37 mm. (442), 203° at 12 mm. (442), 171–173° at 12 mm. (425).]

With organic acids (or their salts). *KCN or NaCN*. [ $\bar{C}$  with alc. KCN (443) (444) (445) (446) in pres. of CuCN and in u.v. light (447), or  $\bar{C}$  with aq. alc. NaCN (160) (448), gives (yields: 80–90% (448), 70–76% (447), 70% (160)) benzyl cyanide ( $\alpha$ -tolunitrile) (phenylacetoneitrile) [Beil. IX-441,  $\text{IX}_1$ -(176)], b.p. 233–234° cor. (3), 231–232° at 755 mm. (449), 135–140° at 38 mm. (448), 118–119° at 20 mm. (450), 107–107.4° at 12 mm. (18); f.p. –24.6° (26), –26.5° (451);  $D_4^{25} = 1.0125$  (452),  $D_4^{20} = 1.0176$  (453), 1.0157 (454);  $n_D^{25} = 1.52105$  (455),  $n_D^{20} = 1.52422$  (453); for removal from this prod. of traces of benzyl isocyanide with aq.  $\text{H}_2\text{SO}_4$  at 60° see (456).]

With salts of aliphatic acids. [ $\bar{C}$  with Na formate + anhydrous formic acid in s.t. at 140° (402) gives benzyl formate (1:3596) q.v.]

[ $\bar{C}$  with KOAc in alc. (443) (457) (460) or benzyl acetate itself (458), or  $\bar{C}$  with  $\text{Pb}(\text{OAc})_2$  in AcOH (459), or  $\bar{C}$  with NaOAc in AcOH (461) cf. (160) or aq. at 115° (160), gives (80% yield (160)) benzyl acetate (1:3751) q.v.; for study of kinetics see (22).]

BEHAVIOR OF  $\bar{C}$  WITH ORGANIC REACTANTS

With hydrocarbons.  $\bar{C}$  with benzene (1:7400) in pres. of widely varied condensing agts. gives diphenylmethane (1:7120), frequently accompanied by *o*-dibenzylbenzene [Beil. V-710,  $V_1$ -(351),  $V_2$ -(621)], m.p. 78-79°, and by *p*-dibenzylbenzene [Beil. V-711,  $V_1$ -(351),  $V_2$ -(621)], m.p. 86°. — [E.g.,  $\bar{C}$  with benzene (1:7400) in pres. of Zn dust (363) (369), Cr powder (364), uranium dust at 100° for 4 hrs. (365), Al powder (preheated in  $H_2$  at 500°) (301), Ti (393), Al/Hg (366) (367), Al +  $HgCl_2$  (368), Al + HCl (368),  $AlCl_3$  (369) (370),  $AlCl_3$ /nitrobenzene cpd. at 30° (372),  $NaCl/AlCl_3$  at 15-20° (373),  $BeCl_2$  at 100° for 6 hrs. (374),  $TiCl_4$  (375),  $ZrCl_4$  (376),  $SnCl_4$ /diethyl etherate (377),  $TiCl_3$  (378), iron pyrites (37),  $Ag_2SO_4$  (379), silver methionate (neutral silver salt of methanedisulfonic acid) (379),  $P_2O_5$  (380), or HF in Cu bomb nt 100° for 15 hrs (381)] gives (yields: 60-63% (368), 60% (372) (374), 56% (381), 52% (373), 49.5-52.5% (366), 40% (365), 38% (301), 35% (375), 30% (376), 22% (363)) diphenylmethane (1:7120).]

[ $\bar{C}$  with toluene (1:7405) in pres. of Zn dust (382) cf. (383) (384), Ti (393),  $AlCl_3$  (369) (370) cf. (385) (386) (371), Al/Hg (367),  $FeCl_3$  (385) (386),  $BeCl_2$  at 110-125° (374), or  $MeMgI$  (387) gives *p*-benzyltoluene [Beil. V-607,  $V_1$ -(286),  $V_2$ -(511)], b.p. 279°.]

[ $\bar{C}$  with *m*-xylene (1:7420) in pres. of Zn dust (388), finely divided Cu (389), or  $BeCl_2$  at 130-140° (374) gives (78.6% yield (384)) phenyl-*m*-xylyl-methane [Beil. V-615,  $V_1$ -(289),  $V_2$ -(518)], b.p. 295-296° cor. (388) (389).]

[ $\bar{C}$  with mesitylene (1:7455) refluxed 60 hrs. without cat. (391), or in pres. of  $AlCl_3$  (390) at 98-100°, or  $BeCl_2$  at 140-160° (374), gives (78% yield (374)) benzylmesitylene (phenyl-2,4,6-trimethylphenyl-methane) [Beil. V-619], m.p. 36-37° (390), 36° (374).]

[ $\bar{C}$  with biphenyl (1:7175) refluxed 3 hrs. without cat. (391), or in pres. of Zn dust at 100° (392), or of Ti (393) gives 4-benzylbiphenyl [Beil. V-708,  $V_2$ -(618)], m.p. 85° (392) (391).]

[ $\bar{C}$  with naphthalene (1:7200) refluxed 3 hrs. without cat. (391), or in pres. of Zn dust (394) (395),  $ZnCl_2$  (396) at not over 125° (397),  $AlCl_3$  (396) (398), Ti (393), or  $P_2O_5$  at 200° (380) gives mainly 1-benzyl-naphthalene [Beil. V-689,  $V_1$ -(341),  $V_2$ -(604)], m.p. 59° (corresp. picric acid addn. cpd., m.p. 100-101° (396) (400)), accompanied by some 2-benzyl-naphthalene [Beil. V-690], m.p. 55-55.5° (398), 55.5° (399) (corresp. picric acid addn. cpd., m.p. 93° (396) (400)). — Note that using  $ZnCl_2$  little 2-benzyl-naphthalene is formed (398), also that polybenzylation may occur (399).]

With alcohols (or alcoholates). [ $\bar{C}$  with  $MeOH/KOH$  (401) or with  $MeOH/NaOMe$  (403) in s.t. at 120° (402) gives benzyl methyl ether (1:7475), b.p. 170-171° cor. (403), 170.5° cor. at 760 mm. (3), 170-171° at 759 mm. (377), 170.2-172.2° at 760 mm (404);  $D_4^{25} = 0.9745$  (405), 0.9594 (403),  $D_4^{20} = 0.9649$  (403);  $n_D^{25} = 1.4983$  (403),  $n_D^{20} = 1.5031$  (405), 1.5008 (403) (corresp. picrate, m.p. 115-116° u.c. (406)). —  $\bar{C}$  with  $EtOH/KOH$  (401),  $EtOH/NaOEt$  (403) (377) (407),  $EtOH/LaOEt$  (407), or  $KOEt/liq. NH_3$  (408) gives (yields: 81% (408), 63-77% (407)) benzyl ethyl ether (1:7530); b.p. 184.7-185.2° at 761 mm. (377), 184-186° cor. (403);  $D_4^{25} = 0.9446$  (403),  $D_4^{20} = 0.9490$  (409), 0.9478 (403);  $n_D^{25} = 1.4934$  (403),  $n_D^{20} = 1.4958$  (403), 1.4955 (409). — For studies of rate of reaction of  $\bar{C}$  with  $EtOH$  (410) (411) or with  $EtOH/NaOEt$  (412) see indic. refs.]

[ $\bar{C}$  with *n*- $PrOH/NaO-n-Pr$  gives (90-93% yield (413) (403)) benzyl *n*-propyl ether [Beil. VI-431,  $V_1$ -(219),  $V_2$ -(410)], b.p. 200-202° cor. (403), 68° at 9 mm. (413);  $D_4^{25} = 0.9480$  (403),  $D_4^{20} = 0.9535$  (403) cf. (413);  $n_D^{25} = 1.4932$  (403),  $n_D^{20} = 1.4953$  (403), 1.4905 (413); for study of rate at 50.6° see (414). —  $\bar{C}$  with *iso*- $PrOH/NaOisoPr$  gives (403) benzyl isopropyl ether, h.p. 192-194° cor.;  $D_4^{25} = 0.9403$ ,  $D_4^{20} = 0.9457$ ;  $n_D^{25} = 1.4876$ ,  $n_D^{20} = 1.4900$  (403).]

[For corresp. prepn. and constants for benzyl *n*-butyl ether (403) (417), benzyl *sec*-butyl ether (417), benzyl isobutyl ether (403), and benzyl isomyl ether (403) see indic. refs.]

[ $\bar{C}$  with  $C_2H_5NH_2$  in 33% aq. soln. with some alc. in s.t. at  $110^\circ$  gives (558) *N*-ethylbenzylamine [Beil. XII-1020, XII<sub>1</sub>-(448)], oil, spar. sol. aq., b.p.  $199^\circ$  (589),  $198^\circ$  at 750 mm. (550),  $194^\circ$  cor. (558),  $191$ – $194^\circ$  u.c. at 740 mm. (548);  $D_{15}^{25} = 0.9350$  (552) ( $\bar{B}$ .P.KOH, m.p.  $122$ – $123^\circ$  (559)), accompanied by *N*-ethyldibenzylamine [Beil. XII-1036], b.p.  $306^\circ$  cor. (558).]

*With aromatic primary amines.* [ $\bar{C}$  (1 mole) with aniline (2 moles) in s.t. at  $160^\circ$  for 24 hrs. (502), or htd. in open vessel at  $140^\circ$  (503), or in pres. of  $I_2$  at  $50^\circ$  (504), in alc. (505) or aq.  $Na_2CO_3$  (160), or  $\bar{C}$  (1 mole) with aniline (4 moles) in aq.  $NaHCO_3$  at  $90$ – $95^\circ$  (506), or  $\bar{C}$  with sodium anilide (from aniline + Na +  $Cu_2O$ ) nt  $30$ – $100^\circ$  under press., (507) gives (yields: 85–87% (506), 56% (160), 49% (504)) *N*-benzylaniline (*N*-phenylbenzylamine) [Beil. XII-1023, XII<sub>1</sub>-(449)], m.p.  $39^\circ$  (508),  $37$ – $38^\circ$  (509),  $37^\circ$  (510),  $36.5$ – $36.8^\circ$  cor. (503),  $36.5^\circ$  (511),  $36^\circ$  (506) (512); b.p.  $306$ – $307^\circ$  at 759 mm. (509),  $201$ – $203^\circ$  at 37 mm. (510),  $178$ – $180^\circ$  at 12 mm. (506),  $171.5^\circ$  at 10 mm. (508);  $D_4^{25} = 1.0298$  (508);  $n_D^{25} = 1.59562$  (508) ( $\bar{B}$ .HCl, m.p.  $214$ – $216^\circ$  (509),  $\bar{B}$ .3,5-dinitrobenzoic acid, m.p.  $133.0^\circ$  cor. (249),  $\bar{B}$ .2,4-dinitrobenzoic acid, m.p.  $121.4$ – $122.2^\circ$  cor. (513),  $\bar{B}$ .*p*-toluenesulfonic acid, m.p.  $148.3$ – $148.8^\circ$  cor. (250)); for method of sepn. of *N*-benzylaniline from *N,N*-dibenzylaniline (below) by reactn. with phthalic anhydride (1:0725) see (514). — For studies of kinetics of reaction of  $\bar{C}$  with aniline in MeOH nt  $35^\circ$  and  $45^\circ$  (515) or in EtOH at  $35^\circ$ ,  $40^\circ$ , and  $45^\circ$  (516) cf. (4) see indic. refs.; for study of rearr. of *N*-benzylaniline to *p*-aminodiphenylmethane see (517)]

[ $\bar{C}$  with aniline on htg. cf. (503) (508) in pres. of NaOH at  $100^\circ$  (518), anhydrous NaOAc +  $I_2$  at  $97^\circ$  (504),  $NaNH_2$  + Cu powder (519), benzyl alc. (520), or aq.  $Na_2CO_3$  (160) gives *N,N*-dibenzylaniline (*N*-phenyldibenzylamine) [Beil. XII-1037, XII<sub>1</sub>-(453)], m.p.  $71$ – $72^\circ$  (521),  $70^\circ$  (522),  $69.5^\circ$  (508),  $69^\circ$  (520),  $67^\circ$  (518); b.p.  $226^\circ$  at 10 mm. (508);  $D_4^{25} = 1.04436$ ;  $n_D^{20} = 1.60647$  (508) ( $\bar{B}$ .HCl, pr. with 1  $H_2O$  from alc. (518), but m.p. unreported;  $\bar{B}$ .P.KOH, m.p.  $131$ – $132^\circ$  dec. (518);  $\bar{B}$ .3,5-dinitrobenzoic acid gives no cpd. (249);  $\bar{B}$ .2,4-dinitrobenzoic acid gives no cpd. (513);  $\bar{B}$ .*p*-toluenesulfonic acid is oil (250);  $2\bar{B}$ .1,3,5-trinitrobenzene, m.p.  $86$ – $87^\circ$  (523)). — For study of rearr. of *N,N*-dibenzylaniline hydrochloride to *p*-aminodiphenylmethane, 2,4-dibenzylaniline, and 2,4,6-tribenzylaniline see (524).]

$\bar{C}$  with other aromatic primary amines behaves similarly but cannot be detailed here; however, for a number of cases see (508).

*With aliphatic secondary amines.* [ $\bar{C}$  with  $(CH_3)_2NH$  in abs. alc. on stdg. (560) or under reflux (546) (561), or in  $C_6H_6$  at  $40$ – $50^\circ$  for 2 days (562), gives (80% yield (561)) *N,N*-dimethylbenzylamine [Beil. XII-1019, XII<sub>1</sub>-(448)], oil, fairly sol. cold but less sol. hot aq., b.p.  $183$ – $184^\circ$  cor. at 765.3 mm. (560),  $180$ – $181^\circ$  nt 749 mm. (540),  $178$ – $179^\circ$  cor. (563),  $177.8$ – $178.2^\circ$  cor. at 766 mm. (561),  $178^\circ$  u.c. (562),  $98$ – $99^\circ$  at 24 mm. (564),  $83.5$ – $85.5^\circ$  at 21 mm. (565),  $66$ – $67^\circ$  at 15 mm. (566),  $n_D^{20} = 1.5157$  (564) ( $\bar{B}$ .HCl, m.p.  $175^\circ$  (562) cf. (566);  $\bar{B}$ .P.KOH, m.p.  $94^\circ$  (532),  $94$ – $95^\circ$  (559)).]

[ $\bar{C}$  with  $(C_2H_5)_2NH$  in s.t. at  $100^\circ$  gives (567) (568) *N,N*-diethylbenzylamine [Beil. XII-1021, XII<sub>1</sub>-(448)], oil, spar. sol. aq., b.p.  $212^\circ$  (569),  $211$ – $212^\circ$  (568) cor. (567),  $209^\circ$  (570) at 755 mm. (551),  $96$ – $98^\circ$  at 17 mm. (564),  $94^\circ$  at 15 mm. (555) ( $\bar{B}$ .P.KOH, m.p.  $120$ – $121^\circ$  (571),  $119^\circ$  (566)).]

*With aromatic secondary amines.* [ $\bar{C}$  htd. with *N*-methylaniline at  $100^\circ$  (521) (525) in pres. of aq.  $Na_2CO_3$  (160), or  $\bar{C}$  with *N,N*-dimethylaniline +  $I_2$  at  $150^\circ$  (504), or  $\bar{C}$  with mixt. of *N*-methylaniline and *N,N*-dimethylaniline at  $150^\circ$  (526), gives (yields: 92.5% (526), 60% (525), 41% (521)) *N*-benzyl-*N*-methylaniline (benzyl-methyl-phenylamine) [Beil. XII-1024, XII<sub>1</sub>-(450)], b.p.  $305$ – $306^\circ$  (527),  $187$ – $188^\circ$  at 26 mm. (525),  $177$ – $178^\circ$  at 18 mm. (526),  $171^\circ$  at 13 mm. (528),  $162$ – $163^\circ$  at 8 mm. (504);  $D_{26}^{20} = 1.0421$  (504),  $D_4^{25} = 1.0475$  (528);  $n_D^{25} = 1.6006$  (504), 1.6071 (528). ( $\bar{B}$ .P.KOH, m.p.  $131^\circ$  (529),  $128$ – $128.5^\circ$  (504),  $127^\circ$  (525),  $109^\circ$  (530),  $105$ – $107^\circ$  (531),  $104^\circ$  (532),  $103.0$ – $103.5^\circ$  (533); note disagreement)]

[ $\bar{C}$  htd. with *N*-ethylaniline (534) in toluene +  $Na_2CO_3$  (535), or  $\bar{C}$  with *N,N*-diethylan-

iline +  $I_2$  at  $150^\circ$  (504), or  $\bar{C}$  with a mixt. of *N*-ethylaniline + *N,N*-diethylaniline at  $150^\circ$  (526), gives *N*-benzyl-*N*-ethylaniline (benzyl-ethyl-phenylamine) [Beil. XII-1026, XII<sub>1</sub>- (450)], b. p.  $285-286^\circ$  sl. dec. at 710 mm. (534),  $212-220^\circ$  at 54 mm. (526),  $185.5-186.5^\circ$  at 22 mm. (535) (536),  $173^\circ$  at 12 mm. (528),  $163-164^\circ$  at 6 mm. (504);  $D_4^{15} = 1.0330$  (528);  $n_D^{25} = 1.5975$  (528) ( $\bar{B}$ .  $PhOH$ , m. p.  $116-117^\circ$  (536),  $114^\circ$  (535),  $113-114^\circ$  (504),  $111-112^\circ$  (533)). — For important study of sulfonation of *N*-benzyl-*N*-ethylaniline see (537).]

*With heterocyclic secondary amines.*  $\bar{C}$  with piperidine reacts vigorously giving (538) (541) (542) *N*-benzylpiperidine [Beil. XX-23, XX<sub>1</sub>- (8)], b. p.  $248^\circ$  (539),  $245-247^\circ$  (540),  $245^\circ$  (538) (541),  $119^\circ$  at 13 mm. (542);  $D_4^{20} = 0.96049$  (542),  $D_4^{16} = 0.9625$  (541),  $D_4^{15} = 0.96451$  (542);  $n_D^{20} = 1.52269$  (542) ( $\bar{B}$ .  $HCl$ , m. p.  $178^\circ$  (543)).]

[Direct reaction of  $\bar{C}$  with morpholine appears never to have been reported; the expected product, viz., *N*-benzylmorpholine [Beil. XXVII-7, XXVII<sub>1</sub>- (203)] (544), has, however, been prepd. by many other methods and has following constants: b. p.  $260-261^\circ$  cor. (545),  $136-136.5^\circ$  at 14 mm. (544),  $128-129^\circ$  at 13 mm. (542);  $D_4^{20} = 1.03874$ ,  $D_4^{15} = 1.03396$  (542) ( $\bar{B}$ .  $HCl$ , m. p.  $244-245^\circ$  dec. (545),  $\bar{B}$ .  $PhOH$ , m. p.  $193.5-195^\circ$  cor. (544),  $184-185^\circ$  (545)).]

*With aliphatic tertiary amines.*  $\bar{C}$  with  $(CH_3)_3N$  in abs. alc. (546) (561) (563) or abs.  $MeOH$  at  $0^\circ$  (572) gives trimethyl-benzyl-ammonium chloride [Beil. XII-1020, XII<sub>1</sub>- (448)], m. p.  $235^\circ$  (572) dec. (546); for studies of behavior of this prod. toward cat. hydrogenation see (573) (574).]

$\bar{C}$  with  $(C_2H_5)_3N$  directly (563) or at  $100^\circ$  in s.t. (567) of (570) gives triethyl-benzyl-ammonium chloride [Beil. XII-1021], but its constants are not reported.]

*With aromatic tertiary amines.*  $\bar{C}$  with *N,N*-dimethylaniline at ord. temp. (575) (577) in  $MeOH$  or  $EtOH$  (576) gives dimethyl-phenyl-benzyl-ammonium chloride [Beil. XII-1025, XII<sub>1</sub>- (450)], tble. of monohydrate from aq. or alc., m. p.  $110^\circ$  (575),  $109.5^\circ$  (578), m. p. anhydrous form,  $116^\circ$  (577); for studies of rate of formn. of this salt in  $MeOH$  at  $29^\circ$  and  $38^\circ$  see (570), for studies of behavior on cat. hydrogenation see (573) (580); for use of this quaternary salt as reagt. for introduction of benzyl radical see (473).]

$\bar{C}$  with *N,N*-diethylaniline in dry  $C_6H_6$  refluxed 30 min. gives (581) diethyl-phenyl-benzyl-ammonium chloride, m. p.  $104^\circ$  (581).]

*With heterocyclic tertiary amines.*  $\bar{C}$  with pyridine directly (582) (583) (584) (585) (586) or on htg. at  $150^\circ$  for 6 hrs. (587) gives *N*-benzylpyridinium chloride [Beil. XX-218, XX<sub>1</sub>- (74)], but this salt is difficult to crystallize (586) and its properties are not well established; for kinetics of the addition see (4) (579). — Note that  $\bar{C}$  with pyridine in pres. of  $Cu$  on htg. gives (588) a mixt. of 2-benzylpyridine and 4-benzylpyridine, but this type of nuclear benzylation cannot be discussed here.]

*With arylhydrazines.*  $\bar{C}$  (1 mole) with phenylhydrazine (2 moles) mixed with cooling (589) and subsequently htd. at  $115-120^\circ$  (590) (591) (592), or refluxed in alc. (593), or  $\bar{C}$  with phenylhydrazine +  $Na$  in  $C_6H_6$  (594) or liq.  $NH_3$  (595), or  $\bar{C}$  with phenylhydrazine +  $NaNH_2$  in liq.  $NH_3$  (73% yield (595)), gives *N*-benzyl-*N*-phenylhydrazine ( $\alpha$ -benzyl-phenylhydrazine) [Beil. XV-532, XV<sub>1</sub>- (164)], oil, b. p.  $216-218^\circ$  at 38 mm. (591),  $207-208^\circ$  at 10 mm. (593) ( $\bar{B}$ .  $HCl$ , m. p.  $176-177^\circ$  (596),  $170^\circ$  (593),  $164-169^\circ$  (595),  $167^\circ$  (594) (595),  $166-167^\circ$  (590); corresp. acetyl deriv., m. p.  $121-122^\circ$  (594) (595); corresp. benzoyl deriv., m. p.  $139-140^\circ$  (590)); note that the *N*-benzyl-*N*-phenylhydrazine is often accompanied (593) (591) by some benzaldehyde *N*-benzyl-*N*-phenylhydrazone, m. p.  $111-112^\circ$  (590),  $111^\circ$  (593) (594). — The isomeric *N*-benzyl-*N'*-phenylhydrazine ( $\beta$  or *sym*-benzyl-phenylhydrazine) [Beil. XV-533, XV<sub>1</sub>- (165)], m. p.  $35-36^\circ$ , is not obtd. by benzylation of phenylhydrazine but only by indirect methods.]

[For analogous use of  $\bar{C}$  in prepn. of *asym*-benzyl-*o*-tolylhydrazine, *asym*-benzyl-*m*-tolylhydrazine, *asym*-benzyl-*p*-tolylhydrazine, etc., see (597).]

*With arylhydroxylamines.*  $\bar{C}$  with *N*-phenylhydroxylamine in pyridine as directed

Colorless crystals from alc. (2).

[For prepn. of  $\bar{C}$  (30-50% yield of mixed solid + liquid stereomers (2)) from 1,2-dichloroethylene (3:5030) + 1,1,2-trichloroethane (3:5330) + 1%  $AlCl_3$  for 5 days at 35-40° sec (2); for formn. of  $\bar{C}$  from 1,2-dichloroethylene (3:5030) with  $HCl$  +  $AlCl_3$  at 50° see (1).]

$\bar{C}$  in  $CCl_4$  treated with  $AlCl_3$  remains colorless and the solution does not (2) evolve  $HCl$ , even on boilg.

$\bar{C}$  in alc. treated with  $Zn$  dust gives (80% yield (2)) 1-chlorobutadiene-1,3 (3:7210), b.p. 68° (2).

$\bar{C}$  dissolved in hot alc. and titrated with  $N/10$   $KOH$  splits off 1.44-1.50 moles  $HCl$  (2).

[A pentachlorobutane obtained (3) from trichloroethylene (3:5170) + 1,1-dichloroethane (3:5035) +  $AlCl_3$  may or may not be identical with  $\bar{C}$ .]

40-47°	(7)		

Colorless pl. with odor like benzaldehyde. — Volatile with steam. — Somewhat sol. cold aq., more sol. hot aq.; eas. sol. alc., ether,  $C_6H_6$ ,  $CS_2$ ,  $AcOH$ . — Forms spar. sol.  $NaHSO_3$  cpd.

[For prepn. of  $\bar{C}$  from *p*-chlorotoluene (3:8287) with  $CrO_2Cl_2$  (10), or by halogenation to *p*-chlorobenzal (di)chloride (3:0700) (7) (46) or *p*-chlorobenzal (di)bromide (11) and their subsequent hydrolysis with fuming  $H_2SO_4$  (6) (12) (13), conc.  $H_2SO_4$  (7), anhydrous oxalic acid (8), or water in a s.t. at 170° (14) (15) see indicated refs.; from *p*-aminobenzaldehyde by diazotization and reactn. with  $CuCl$  (73% yield (10)) see (10) (17) (1); from *p*-chlorobenzyl chloride (3:0220) (or bromide) by boilg. with aq.  $Pb(NO_3)_2$  in  $CO_2$  (4) (5) or with hexamethylenetetramine (2); from *p*-chlorobromobenzene via *p*-chlorophenyl  $MgBr$  and its reactn. with ethyl orthoformate (64% yield) (18); from *p*-chlorobenzonitrile with  $SnCl_2$  (10); from chlorobenzene +  $HCN$  +  $AlCl_3$  (20) or with  $CO$  +  $AlCl_3$  (21); from *p*-chlorobenzylamine with hexamethylenetetramine (45) see indic. refs.]

$\bar{C}$  with  $KMnO_4$  (2) (4) (5) or even slowly in air oxidizes to *p*-chlorobenzoic ac. (3:4910), m.p. 236°. [For study of auto-oxidation see (22).] —  $\bar{C}$  on cat. hydrogenation (92% yield (23)) or electrolytic reductn. (24) or by actn. of iodo-magnesium hydrobenzoate (84% yield (25)) gives *p*-chlorobenzyl alc., ndls. from  $C_6H_6$ /gr., m.p. 71-72.5° (23). —  $\bar{C}$  with conc. alk. undergoes Cannizzaro reactn. (for study see (20) (28)) although presumable products, *p*-chlorobenzyl alc. and *p*-chlorobenzoic ac., have not been (by this reactn.) actually isolated. [For study of  $\bar{C}$  in mixed Cannizzaro reactn. see (27).]

$\bar{C}$  on reduction with  $Ni/Al$  alloy (Raney  $Ni$ ) in aq. alk. gives (60% yield (48)) toluene (1:7405).

$\bar{C}$  with dil.  $KCN$  gives benzoin condensation yielding 4,4'-dichlorobenzoin, m.p. 85-87° (26), which on oxidn. with  $HNO_3$  in  $AcOH$  yields 4,4'-dichlorodibenzil, m.p. 165-166° (29).

$\bar{C}$  on litg. with  $NaOAc$  +  $Ac_2O$  for 8 hrs. at 180-200° undergoes Perkin reactn. giving (yield: 52% (13), 60% (17)) *p*-chlorocinnamic ac., m.p. 240-250° (17), 247° (13) (31). [This with  $Br_2$  in  $CHCl_3$  gives (30) *p*-chlorocinnamic acid dibromide, m.p. 161° (30).] —  $\bar{C}$  + malonic acid + pyridine gives alm. quant. yield (31) *p*-chlorocinnamic acid. [With-

75.3-76.0° at 14 mm.	(6)	$D_4^{17.9} = 1.1526$ (6)	$n_D^{17.9} = 1.4509$ (6)
66° at 10 mm.	(7)		

[See also ethyl  $\beta$ -chloroisocrotonate (3:8325).]

[For prepn. of  $\bar{C}$  from  $\beta$ -chlorocrotonic acid (3:2625) in EtOH with HCl gas (100% yield (2)) (4) or with conc.  $\text{H}_2\text{SO}_4$  (7) see indic. refs.]

[For formn. of  $\bar{C}$  from ethyl acetoacetate (1:1710) with  $\text{PCl}_5$  as a by-product of prepn. of ethyl  $\beta$ -chloroisocrotonate (3:8325) see (8) (9), but this is definitely not a good means of prepn. of  $\bar{C}$ .]

[ $\bar{C}$  with Al/Hg in alc. on warming is both dehalogenated and hydrolyzed yielding (10) crotonic acid (1:0425); note that with  $\bar{C}$  this reactn. goes more readily than with the isomeric ethyl  $\beta$ -chloro-isocrotonate (3:8325).]

[ $\bar{C}$  (2 moles) with  $\text{K}_2\text{S}$  ( $1\frac{1}{2}$  moles) in 5 vols. abs. EtOH refluxed 16 hrs. (11) or  $\bar{C}$  with Na enolate of ethyl thioacetoacetate (14) gives (53% yield (11)) diethyl  $\beta,\beta'$ -thiodicrotonate

$\text{S}(-\text{C}(\text{CH}_3)=\text{CH}.\text{COOC}_2\text{H}_5)_2$ , h p. 150–153° at 4 mm. (11), accompanied by some ethyl  $\beta$ -mercaptocrotonate (see below).]

[ $\bar{\text{C}}$  with alc. NaSH (12) or alc. KSH (11) (13) gives (30% yield (13)) ethyl  $\beta$ -mercaptocrotonate; note that this prod. is apparently a mixt. of the two geom. stereoisomers of ethyl  $\beta$ -mercaptocrotonate with the corresp. keto form, viz., ethyl thioacetoacetate,  $\text{CH}_3-\text{CS}-\text{CH}_2-\text{COOC}_2\text{H}_5$ ; for details see indic. refs. — Note also that, since the same prod. results by similar treatment of the isomeric ethyl  $\beta$ -chloroisocrotonate (3:8325), a mixture of the stereoisomers can be used as the starting material.]

[ $\bar{\text{C}}$  with alkali derivs. of alcohols, phenols, mercaptans, etc., splits out alkali halide yielding corresp. ethyl  $\beta$ -substituted crotonates: e.g.,  $\bar{\text{C}}$  with Na allylate gives (9) ethyl  $\beta$ -allyloxycrotonate;  $\bar{\text{C}}$  with Na cinnamylate gives (9) ethyl  $\beta$ -cinnamyloxycrotonate;  $\bar{\text{C}}$  with Na phenolate gives (15) cf. (16) ethyl  $\beta$ -phenoxyacrylate, h.p. 147–148° at 14 mm. (15);  $\bar{\text{C}}$  with Na salt of ethyl mercaptan gives (17) ethyl  $\beta$ -ethylmercaptocrotonate, h.p. 139–141° at 16 mm. (17);  $\bar{\text{C}}$  with Na salt of benzyl mercaptan gives (90% yield (17)) ethyl  $\beta$ -benzylmercaptocrotonate, cryst. from lig., m.p. 64.5° (17). Note that in the first three of the five preceding examples either  $\bar{\text{C}}$  or the isomeric ethyl  $\beta$ -chloroisocrotonate (3:8325) or their mixture gives the same result; for the last two, however, such is not the case.]

[ $\bar{\text{C}}$  with diethyl sodiomalonate gives (5) cf. (18) *trans* diethyl  $\alpha$ -carbethoxy- $\beta$ -methyl gluconate,  $(\text{C}_2\text{H}_5\text{OOC})_2\text{CH}.\text{C}(\text{CH}_3)=\text{CH}.\text{COOC}_2\text{H}_5$  [Beil. II-853], b.p. 169–170° at 13 mm.,  $D_4^{20} = 1.0937$ ,  $n_D^{20} = 1.4595$  (5); cf. behavior of stereoisomeric ethyl  $\beta$ -chloroisocrotonate (3:8325).]

$\bar{\text{C}}$  with phenylhydrazine gives the same (2) products as obtd. from the stereoisomeric ethyl  $\beta$ -chloroisocrotonate (3:8325): e.g.,  $\bar{\text{C}}$  (1 mole) with phenylhydrazine (1 mole) at 100° for 6–8 hrs. gives by ring closure mainly (2) 3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-20, XXIV-1-(190)], pr. from aq., m.p. 127°, accompanied by small amts. of 4-benzene-azo-8-methyl-1-phenylpyrazolone-5 [Beil. XXIV-328, XXIV-1-(319)], m.p. 155–156°, and 3,3'-dimethyl-1,1'-diphenyl-bis-pyrazolone-5,5' [Beil. XXVI-484], dec. at high temp. without melting. — Note that with excess phenylhydrazine (2–4 moles) only traces of the 3-methyl-1-phenylpyrazolone-5 are formed while the amt. of the other two (less desirable) products is greatly increased (2).

## 3:8665 4-CHLORO-1,3-DIMETHYLBENZENE

(*unsym.*-Chloro-*m*-xylene)

 $CH_3$  $C_8H_9Cl$ 

Beil. V - 373

V<sub>1</sub>-(183)V<sub>2</sub>-(291)

B.P. 192.2-193.9° (1) (?)

187-188° at 755 mm. (2)

186.5° cor. at 767 mm. (3)

183-184° (6)

73-75° at 16 mm. (4)

 $D_{20}^{20} = 1.0598$  (3)  $n_D^{20} = 1.5230$  (5)

3:8657 ETHYL  $\gamma$ -CHLOROCROTONATE

Beil. II - 418

II<sub>1</sub>—II<sub>2</sub>-(397)

B.P. 191–193° at 760 mm. (1)

 $D_4^{15} = 1.130$  (2) $n_D^{15} = 1.4625$  (2)

84–85° at 15 mm. (2)

80° at 10 mm. (3)

77–82° at 12 mm. (4)

66–68° at 2 mm. (3)

[See also  $\gamma$ -chlorocrotonic acid (3:2170).]

Although  $\tilde{C}$  is capable of existing in two geometrically isomeric forms, only this one is known; collateral evidence (but not actual proof) indicates that  $\tilde{C}$  is the *trans* stereoisomer.

[For prepa. of  $\tilde{C}$  from ethyl vinylacetate [Beil. II-407] (5) with  $Cl_2$  in  $CCl_4$  (forming ethyl  $\beta,\gamma$ -dichloro-*n*-butyrate) followed by treatment with alc. NaOEt at 0° (splitting out HCl) and giving 65% yield see (5); from ethyl  $\gamma$ -chloro- $\beta$ -hydroxy-*n*-butyrate [Beil. III-310, III<sub>1</sub>-(116)] by dehydration with  $P_2O_5$  (yields: 65% (4), 62.5% (3), 60% (2)) (6) (accompanied by some  $\gamma$ -chlorocrotonic acid (3:2170) (3) (2) and also by ethyl  $\gamma$ -chloro-vinylacetate (3)) see indic. refs.]

$\tilde{C}$  on hydrolysis with  $Ba(OH)_2$  below 0° or even (but less advantageously) with KOH gives (60% yield (3) (5)) (7) (2)  $\gamma$ -chlorocrotonic acid (3:2170), m.p. 83°; note, however, that hydrolysis with hot conc. alk. gives also two other products, viz.,  $O(CH_2-CH=CH-COOH)_2$ , m.p. 195° (2), and  $\gamma$ -hydroxycrotonic acid, m.p. 108° (2).

[ $\tilde{C}$  in EtOH/NaOEt undergoes addition of EtOH to unsatd. linkage followed to small extent by elimination of HCl with consequent ring closure to a cyclopropane deriv.; e.g.,  $\tilde{C}$  (0.134 mole) in 2½ pts. EtOH treated dropwise in cold with soln. of Na (0.057 mole) in the same vol. of EtOH as above gives (yields 42% (8), 25% (9)) ethyl  $\gamma$ -chloro- $\beta$ -ethoxy-*n*-butyrate, b.p. 108.0–108.5° at 20 mm.,  $D_4^{17.5} = 1.078$ ,  $n_D^{17.5} = 1.4295$  (8), accompanied by a little (3% yield (8)) ethyl 2-ethoxycyclopropane-1-carboxylate (1-carbethoxy-2-ethoxycyclopropane), b.p. 77.50–77.75° at 13 mm.,  $D_4^{13} = 0.995$ ,  $n_D^{13} = 1.453$  (8); the latter is also obt'd. (22% yield (9)) by distn. of the ethyl  $\gamma$ -chloro- $\beta$ -ethoxy-*n*-butyrate with dry powdered KOH at 180° and 45 mm. press.]

[ $\tilde{C}$  on dropwise addition to dry powdered KOH at 180° gives ethyl cyclopropane-1-carboxylate [Beil. IX-4, IX<sub>1</sub>-(3)], b.p. 130° at 728 mm.,  $D = 0.970$ ,  $n_D^{15} = 1.416$ .]

[ $\tilde{C}$  with excess dry powdered  $CaBr_2$  heated several days under reflux gives (2) (10) ethyl  $\gamma$ -bromocrotonate. —  $\tilde{C}$  (1 mole) with NaI (1 mmole) in acetone reacts readily at ord. temp. pptg. NaCl (80% theory) and yielding (3) ethyl  $\gamma$ -iodocrotonate, b.p. 92–93° at 2 mm.]

[ $\tilde{C}$  with NaOAc in AcOH heated at 100° cf. (11) yields (8) ethyl  $\gamma$ -acetoxycrotonate, b.p. 115–116° at 15 mm.,  $D_4^{23} = 1.075$ ,  $n_D^{23} = 1.4445$  (11).]

[ $\tilde{C}$  with conc. aq.  $NH_4OH$  not only has its halogen replaced by  $-NH_2$  but also is hydrolyzed with consequent formn. of  $\gamma$ -amiacrotonic acid; this was not isolatable as such but only as its picrate, the m.p. of which, however, is not reported (2).]

[ $\tilde{C}$  with  $Me_3N$  (excess) in alc. coatg. a trace of NaI in s.t. at 100° followed by evapa. with HCl gives (4)  $\gamma$ -dimethylamiacrotonic acid chloromethylate ( $\gamma$ -dimethylaminocrotonbetain chloride), m.p. 203–205° dec. (4).]

 $D_4^{20} = 1.0620$  (9)  $n_D^{20} = 1.5276$  (9) $D_4^{15} = 1.0598$  (6)  $n_D^{15} = 1.5337$  (6)

$\bar{C}$  even on stdg. tends to lose HCl with formn. of styrene and styrene polymers (9); such decompn. is facilitated by pres. of any HCl and  $\bar{C}$  could not be dried with  $P_2O_5$  (10).

[Both opt. act. stereoisomerides of  $\bar{C}$  are known but cannot be discussed here.]

[For prepn. of  $\bar{C}$  from methyl-phenyl-carhinol (1:6475) with 6 *N* HCl (75% yield (3)) (7), with aq. HCl in pres. of  $CaCl_2$  (2) (8), with HCl +  $ZnCl_2$  (71% yield (11)), with  $SOCl_2$  (82-88% yield (11)) (4) (5) (10), or with acetyl chloride (3:7065) (12) see indic. refs.; from ethylbenzene (1:7410) with  $Cl_2$  in light (1) (13) (14) (15) or in pres. of 1%  $PCl_5$  (90% yield (16)) see indic. refs.; from styrene (1:7435) by addn. of HCl (9) (17) (18) under press. in solvent (100% yield (19)) or at  $-80^\circ$  (68% yield (29)) see indic. refs.; for forma. of  $\bar{C}$  from methyl-phenyl-carhinyl  $MgBr$  during reaction with cyanogen chloride (47%  $\bar{C}$  + 10% methyl-phenyl-carhinyl cyanide + 5% 2,3-diphenylbutane) see (6); for formn. of  $\bar{C}$  from methyl phenyl ketone (acetophenone) (1:5515) during reduction with  $Zn/Hg$  + HCl see (20).]

[ $\bar{C}$  passed at elevated temp. over dehydrohalogenating cat. (21), or htd. with pyridine in a.t. 6 hrs. at  $130^\circ$  (77% yield (22)), or hoiled with a small excess quinoline for  $\frac{1}{2}$  hr. (75-80% yield (16)) (23), or its quat. salt with pyridine htd. in vac. (24), or htd. with acids less volatile than HCl (25), or htd. with salts of org. bases (26) (23) yields styrene (1:7435), h.p.  $145^\circ$ .]

[ $\bar{C}$  with  $H_2$  and Pd in pres. of  $MgO$  as specified (8) gives rapidly and quant. ethylbenzene (1:7410); note that  $\bar{C}$  reduces much more readily than the isomeric  $\beta$ -chloroethylbenzene (3:8712) (8).]

$\bar{C}$  on hydrolysis, e.g., by hoilg. with 25% excess of 10-15% aq.  $Na_2CO_3$  soln., gives (90% yield (16)) (27) methyl-phenyl-carbinol (1:6475) q.v.;  $\bar{C}$  with aq. alc. or with aq. alc. NaOH gives at  $50^\circ$  only (5) methyl-phenyl-carbinol; nt  $100^\circ$  both styrene (1:7435) and  $\alpha,\alpha$ -diphenyl-diethyl ether are also formed (5); under certain circumstances  $\alpha$ -diphenyl-diethyl ether may also appear (5) (1). [For study of hydrolysis of  $\bar{C}$  in acetone contg.  $HgCl_2$  see (4).]

[ $\bar{C}$  with aq.  $Na_2SO_3$  on hoilg. for 9 hrs. (14) (7) gives (43-45% yield (14)) sodium  $\alpha$ -phenylethanesulfonate (corresp. sulfinyl chloride, ndla. from alc., m.p.  $79^\circ$  (14) cf. (7), corresp. sulfonamide and anilide are unreported).]

$\bar{C}$  on oxidn. with  $Cu(NO_3)_2$  (13) nt on boilg. with aq. or dil. alc. soln. of hexamethylene-tetramine (28) gives (60% yield (13)) methyl phenyl ketone (acetophenone) (1:5515).

Colorless liq. with arom. odor soon changing to that of formaldehyde and benzoyl chloride from air oxidation (5). —  $\bar{C}$  could not be polymerized even in u.v. light, by peroxides or  $SnCl_4$  (12).

[For prepn. of  $\bar{C}$  from methyl phenyl ketone (acetophenone) (1:5515) with  $PCl_5$  see (2) (1) (5) (6), from  $\alpha,\alpha$ -dichloroethylbenzene ("acetophenone dichloride") on htg. see (7); from  $\beta$ -bromo- $\alpha$ -chloroethylbenzene (styrene chloro-bromide) with alc. KOH in the cold (70% yield) see (4); from  $\alpha,\beta$ -dichloroethylbenzene (styrene dichloride) (3:6685) with aq. alc. NaOH at 50-60° (89% yield) see (13)]

$\bar{C}$  on boudg. with conc.  $HCl$  (4) (1), or  $\bar{C}$  with 80%  $H_2SO_4$  at 50° for 4 hrs. (13) cf. (14), gives (81% yield (13)) cf. (14) acetophenone (1:5515).

$\bar{C}$  is resistant to actn. of alc. KOH (5);  $\bar{C}$  on refluxing for 13 hrs. with very conc. alc. NaOEt gives (8) some phenylacetylene (1:7425) together with other prods. (5).

[ $\bar{C}$  with NOCl yields (9)  $\alpha,\beta$ -trichlorostyrene, b.p. 148–150° at 20 mm. (9);  $\bar{C}$  htd. with alc. KCN in s.t. at 200–220° yields (10) phenylsuccinonitrile which on saponification gives phenylsuccinic acid (1:0790);  $\bar{C}$  with Na in liq.  $NH_3$  gives (15% yield (10)) ethylbenzene (1:7410);  $\bar{C}$  with  $NaNH_2$  in liq.  $NH_3$  gives (57% yield (11)) phenylacetylene (1:7425);  $\bar{C}$  in alc. contg.  $BF_3/EtOAc$  (12) or in pres. of HCl (1) condenses with itself by loss of 3 HCl yielding 1,3,5-triphenylbenzene (1:7270).]

$\bar{C}$  (10 g.) in  $C_6H_6$  (10 ml.) stood 3 days with  $PCl_5$  (30 g.) in  $C_6H_6$  (50 ml.), then poured into aq. worked up as directed (13), yields 1-phenyl-1-chloroethylenephosphinic acid-2,  $C_6H_5-C(Cl)=CH-P(=O)(OH)_2$ , ndls. from dil. HCl, m.p. 162° (13) (together with a little benzoic acid (1:0715), m.p. 121°).

Liquid with odor of hyacinth; used in perfume industry. Although  $\bar{C}$  should exist in two geom. stereoisomeric forms only this one has as yet been recognized. — Volatile with steam.

[For prepn. of  $\bar{C}$  from cinnamic acid (1:0735) with  $Cl_2$ /aq. or  $HOCl$  (1) (3) (10) (8) (12), with  $Cl_2$  in EtOH (11), with  $NaOCl$  (13) (20), or  $Ca(OCl)_2$  (14) see indic. refs.; from  $\alpha,\beta$ -dichlorohydrocinnamic acid (cinnamic acid dichloride) [Beil. IX-514, IX<sub>1</sub>-(200)] with  $Na_2CO_3$  at 100° (yield: 97% (15) (1)) (9) (6) or with  $NaOAc$  (60% yield (5)) see indic. refs.; from  $\alpha$ -chloro- $\beta$ -hydroxyhydrocinnamic acid [Beil. X-250, X<sub>1</sub>-(110)] by htg. with aq. in s.t. at 200–220° see (2) cf. (3); for formn. of  $\bar{C}$  from  $\omega,\omega$ -dichloroethylbenzene [Beil. V-354] with alc. KOH in s.t. at 120° see (4); from phenyl-trichloromethyl-carbinol [Beil. VI-476, VI<sub>1</sub>-(237)] with Zn dust in alc. see (16); from  $\alpha,\beta$ -dichloroethylbenzene (styrene dichloride) (3:6685) by htg. with pyridine (17) or by passing over  $Al_2O_3$  at 360–400° and 85–105 mm. (92% yield (20)) see indic. refs.; from  $C_6H_5MgBr$  with acetylene tetrachloride (3:5750) see (18); from styrene chlorohydrin (3:9570) by dehydration over  $HPO_3$  on silica gel at 370–400° and 95–115 mm. (63% yield) see (20).

[ $\bar{C}$  with  $Cl_2$  in  $CHCl_3$  yields (1)  $\alpha,\beta$ -trichloroethylbenzene [Beil. V-355], h.p. 254.5–255.5° sl. dec. at 770 mm., h.p. 137° at 21 mm.,  $D_4^{15} = 1.3619$ ,  $n_D^{15} = 1.5652$  (1);  $\bar{C}$  with

$\text{Br}_2$  in  $\text{CHCl}_3$  yields (1) (13) (19)  $\beta$ -chloro- $\alpha,\beta$ -dibromoethylbenzene [Beil. V-356], ndls. from alc., m.p.  $32^\circ$  (1) (13), b.p.  $165^\circ$  sl. dec. at 26 mm. (1).

$\bar{\text{C}}$  with alc. KOH in s.t. at  $200\text{--}250^\circ$  is partly resinsified (2);  $\bar{\text{C}}$  with very conc. alc. KOH gives on very strong htg. a chlorine-free oil which on distn. with aq. gives phenylacetaldehyde (1:0200) (4). [For rate of loss of halogen with alc. KOH see (5).] —  $\bar{\text{C}}$  with EtOH/NaOEt in s.t. at  $175\text{--}182^\circ$  for  $5\frac{1}{2}$  hrs. gives (66% yield (20))  $\beta$ -ethoxystyrene [Beil. VI-564, VI-(279)] for conversion of which to phenylacetaldehyde see (20).]

$\bar{\text{C}}$  on oxidn. with  $\text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$  or with  $\text{HNO}_3$  ( $D = 1.2$ ) gives (2) benzoic acid (1:0715).

B.P. 204°

M.P. 42°

See 3:0460. Division A: Solids.

3:8725 2-CHLORO-1,3,5-TRIMETHYLBENZENE  
(*eso*-Chloromesitylene)

B.P. 204-206° (1)

103.6-103.7° at 25 mm. (2)

90-91° at 20 mm. (3)

$D_4^{20} = 1.0337$  (2)  $n_D^{20} = 1.52119$  (2)

$\bar{C}$  remains liquid down to  $-20^\circ$ .  $\bar{C}$  is insol. aq., eas. sol. alc. or ether; volatile with steam but less so than dichloromesitylene.

[For prepn. of  $\bar{C}$  from 1,3,5-trimethylbenzene (mesitylene) (1:7455) with  $\text{Cl}_2$  either directly (1) or in  $\text{CHCl}_3$  at  $0^\circ$  (75% yield (3)) accompanied by 2,4-dichloro-1,3,5-trimethylbenzene (1) and/or 2,4,6-trichloro-1,3,5-trimethylbenzene, m.p. 209° (3), 204-205° (1), or from 2,4,6-trimethylphenol (mesitol) (1:1467) with  $\text{PCl}_5$  in  $\text{C}_6\text{H}_6$  (2) see indic. refs.]

$\bar{C}$  with fuming  $\text{H}_2\text{SO}_4$  (20%  $\text{SO}_3$ ) shaken for 15 min. gives 2-chloromesitylenesulfonic acid

(corresp. sulfonyl chloride, oil (3), sulfonamide, m.p. 165.5-166° (3)) but gives no evidence of any Jacobsen rearrangement (3).

$\bar{C}$  with fuming  $HNO_3$  yields (1) (4) mainly 4,6-dinitro-2-chloromesitylene, colorless ndls. from alc., m.p. 178-179° (1), 176.5° (4) [the mononitration prod., 4-nitro-2-chloromesitylene, has m.p. 56-57° (1)].

$\bar{C}$  on oxidn. with boilg. dil.  $HNO_3$  (1 conc.  $HNO_3$ : 2 aq.) for 30 hrs. yields (1) 4-chloro-3,5-dimethylbenzoic acid ("chloromesitylenic acid") [Beil. IX-536], browns at 220° but does not melt (unsuitable as derivative). [Note that a little 4-nitro-2-chloromesitylene m.p. 56-57° (1), may be formed in this process; furthermore that attempts to oxidize  $\bar{C}$  with  $K_2Cr_2O_7$  + dil.  $H_2SO_4$  yield only acetic acid (1).]

$\bar{C}$  on oxidn. with aq.  $KMnO_4$  gives (63.5% yield (5)) 2-chlorobenzenetricarboxylic acid-1,3,5 (chlorotrimelic acid) (3:4975), readily sol. cold aq., excessively sol. hot aq., m.p. anhydrous acid 285° (5), monohydrate 278° (6).

[ $\bar{C}$  on oxidn. with 15 pts. hoilg. dil.  $HNO_3$  ( $D = 1.24$ ) gives (2) a mixt. of 3-chloro-4-isopropylbenzoic acid (3-chlorocuminic acid) [Beil. IX-549], m.p. 122-123°, 2-chloro-4-methylbenzoic acid (2-chloro-*p*-toluic acid) (3:4355), m.p. 155°, and 2-chloroterephthalic acid (3:4995), m.p. about 320°.]

[ $\bar{C}$  on mononitration with 6 pts. conc.  $HNO_3$  ( $D = 1.48$ ) below 15° for 3-4 hrs. as directed (4) yields 6-nitro-3-chloro-*p*-cymene = 2-nitro-5-chloro-*p*-cymene [Beil. V-424], oil, b.p. 142-150° at 13 mm. (4) (which with piperidine for 30 min. at 100° yields (4) 2-nitro-5-piperidino-*p*-cymene, oil, b.p. 146-148° at 32 mm. (4)).]

$\bar{C}$  on dinitration by adding to 10 pts. conc.  $HNO_3$  ( $D = 1.5$ ) below -5° during 15 min., then poured onto ice, yields (4) (9) a mixt. from which can be isolated 2,6-dinitro-3-chloro-*p*-cymene, m.p. 105-106° (9), 102.5-103.5° (4) (which with piperidine (5 pts.) at 100° for 1½ hrs. yields 2,6-dinitro-3-piperidino-*p*-cymene, pale yel. ndls. from alc., m.p. 126-127° (9), 123-124° (4)).

[During this dinitration of  $\bar{C}$  there is also formed a by-prod. formerly (4) supposed to be 2-chloro-3,5-dinitro-4-methylacetophenone but more recently (10) shown to be 3-chloro-4,6-dinitrotoluene, m.p. 90.0-90.5° (10); this prod. with piperidine gives (10) 3-piperidino-4,6-dinitrotoluene, m.p. 116-116.5° (10).]

[For prepn. of  $\bar{C}$  from benzene (1:7400) + methallyl chloride (3-chloro-2-methylpropene-1) (3:7145) by condensation in presence of conc.  $H_2SO_4$  (68% yield (1)) or HF (66% yield (2)) see (1) (2); for formn. from *ter*-butylbenzene (1:7460) by treatment with  $SO_2Cl_2$  see (3); for formn. from corresp. alc. (2-methyl-2-phenylpropanol-1) with  $SOCl_2$  see (5) (4).]

$\bar{C}$  btd. with 13% alc. KOH at 86° for 24 hrs. is unchanged (2);  $\bar{C}$  refluxed 11½ hrs. with NaOEt in abs. alc. (1) or refluxed 9½ hrs. with pyridine (1) is recoverable to extent of 87-88% (1).

[For study of behavior of  $\bar{C}$  with Na, Na in liq.  $NH_3$ , NaEt,  $NaNH_2$ , etc., or on pyrolysis see (1).]

$\bar{C}$  with sublimed Mg (not comml. Mg even after activation) + a trace of  $I_2$  yields (3) neophyl  $MgCl$ ; this  $RMgCl$  on oxidation with  $O_2$  gives (71.6% yield (1)) the corresp. alc., 2-methyl-2-phenylpropanol-1, b.p. 131° at 30 mm. (1), 122-123° at 20 mm. (5),  $n_D^{20} = 1.5261$  (*N*-phenylcarbamate, m.p. 59-60° (5), 59.5-60.5° (1); *N*-( $\alpha$ -naphthyl)carbamate, m.p. 01.5-02.5° (1)). [For behavior of  $\bar{C}$  with  $C_6H_5MgBr$  in pres. of  $CoBr_2$  see (8).]

③  $\beta$ -Phenylisovaleric acid: cryst. from pet. eth., m.p. 57.5-58.5° (6), 58-59.5° (1).

[From  $RMgCl$  on carbonation and subsequent hydrolysis, yield 81.6% (1).]

④  $\beta$ -Phenylisovaleranilide: m.p. 122-123° (3), 121-123° (6) [from  $RMgCl$  by reactn. with phenyl isocyanate (3)].

⑤ *p*-Acetamino-( $\beta$ -chloro-*ter*-butyl)benzene: m.p. 155-156° (7). [From  $\bar{C}$  by nitration, reduction, and acetylation (7).]

108-109° at 14 mm. (6)

100° at 14 mm. (7)

Liq. with odor and lachrymatory effect less than that of benzyl chloride (3:8535) but with irritating effect on skin (1). —  $\bar{C}$  on boilg. (4) (espec. in presence of  $ZnCl_2$ ) partially dec. with formn. of a hydrocarbon  $C_{20}H_{24}$  (probably 2,6-di-isopropyl-9,10-dihydroanthracene [Beil. V-654]), yel. pdr., m.p. 90° (4).

[For prepn. of  $\bar{C}$  from *p*-isopropylbenzene (cumene) (1:7440) with trioxymethylene (75% yield (1)) or formalin (75% yield (7)) +  $HCl$  +  $ZnCl_2$  see (1) (7); with chloromethyl methyl ether (3:7085) +  $SnCl_4$  see (8); from *p*-cymene (1:7505) by direct chlorination see (4) (3) (9); from cumylal alc. [Beil. VI-543] with dry  $HCl$  (10) or const.-boilg.  $HCl$  (100% yield (2)) see (10) (2) (9).]

$\bar{C}$  with  $Zn$  +  $HCl$  reduces (10) to *p*-cymene (1:7507). —  $\bar{C}$  on boilg. with aq.  $Pb(NO_3)_2$  soln. (7) or alk.  $Na_2Cr_2O_7$  (12) yields *p*-isopropylbenzaldehyde (cuminaldehyde) (1:0234). —  $\bar{C}$  with aq. alk. presumably (no record) yields cumyl alcohol [Beil. VI-543] but with alc.  $KOH$  gives (4) ethyl cumyl ether [Beil. VI-544], b.p. 227° (4).

$\bar{C}$  with  $Mg$  in dry ether yields (9) cumyl  $MgCl$  accompanied by some hicumyl (4,4'-diisopropylidihenzyl) [Beil. V-623], m.p. 58° (9); the  $R.MgCl$  with aq. gives (74% yield (1)) *p*-cymene (1:7505); the  $R.MgCl$  upon treatment with  $O_2$  gas gives (71-80% yield (9)) cumyl alcohol [Beil. VI-543], b.p. 246° cor. (9), 140° at 20 mm. (9); the  $R.MgCl$  with  $CO_2$  gives (73% yield (9)) after acidification *p*-isopropylphenylacetic acid (homocuminic ac.) [Beil. IX-561], m.p. 52°, b.p. 195° at 30 mm., 190° at 25 mm.,  $D_4^{15} = 1.039$ ,  $n_D^{15} = 1.522$  (9). [The  $R.COOMgCl$  cpd. if treated with isopropyl  $MgCl$  gives mainly (11) *p*-isopropylmalonic ac., m.p. 143.5° dec. (1).]

Oil, insol. aq.; eas. sol. alc., ether.

[For prepn. of  $\bar{\text{C}}$  from ethylene chlorohydrin (3:5552) with  $\text{BzCl}$  (3:6240) on htg. (yields: 90% (1), 84.5% (6), 55% (2)) (5) see indic. refs.; from ethylene glycol (1:6465) with benzoic acid (1:0715) at 100° in pres. of  $\text{HCl}$  gas (7); from ethylene oxide (1:6105) with  $\text{BzCl}$  (3:6240) at 190° (8); from 1,4-dioxane (1:6400) with  $\text{BzCl}$  (3:6240) +  $\text{TiCl}_4$  (2 moles) at 150-180° for 10 hrs. (70% yield (9)); from ethylene +  $\text{BzOH}$  (1:0715) +  $\text{Cl}_2$  + cat. as directed (10) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from  $\beta$ -chloroethyl iminobenzoate on warming (3), from  $\beta$ -chloroethyl *p*-toluenesulfonate with  $\text{C}_6\text{H}_5\text{COOMgBr}$  (5% yield (11)), or from *bis*-( $\beta$ -chloroethyl) sulfate with  $\text{NaOBz}$  at 170° (61.5% yield (4)) see indic. refs.]

$\bar{\text{C}}$  on htg. either alone or with  $\text{SnCl}_4$  at 180-200° for 25 hrs. gives (9) ethylene glycol dibenzoate, m.p. 73°.

[ $\bar{\text{C}}$  on a mononitration is claimed (1) to yield mainly  $\beta$ -chloroethyl *m*-nitrobenzoate, but this alleged prod. is not described either in the article or elsewhere in the literature.]

$\bar{\text{C}}$  with  $\text{NaI}$  (2 moles) in 90% alc. refluxed 5 hrs. gives (80% yield (1))  $\beta$ -iodoethyl benzoate, b.p. 161-163° at 17 mm. (1).

3:8980 4-CHLORO-2-PHENYLPHENOL  
(5-Chloro-2-hydroxybiphenyl)

 $C_{12}H_9OCl$ 

Beil. S.N. 539

B.P. 319° at 746 mm. (1)  
178° at 15 mm. (1)  
166-171° at 10 mm. (2)  
128-130° at 2 mm. (3)

M.P. +11° (1) (4)

[See also 6-chloro-2-phenylphenol (3:1757).]

Important Note: Through the year 1944 (and perhaps in some cases beyond) the chloro-phenylphenol of m.p. + 11° (C) was regarded as having the structure 6-chloro-2-phenylphenol = 3-chloro-2-hydroxybiphenyl. In 1945, however, this view was corrected by the paper of Weissberger and Salminen (3); in this text, therefore, expression of the facts is reported in the light of their paper. Particular care is, therefore, required in consulting references prior to it since such material is universally expressed in the reverse sense of the present view.

[For prepn. of C from 2-hydroxybiphenyl (1:1440) with  $Cl_2$  (note that 6-chloro-2-phenylphenol (3:1757) is also formed) see (1) (4) (3), for prepn. of C from 5-amino-2-hydroxybiphenyl (5) by diazotization and use of  $Cu_2Cl_2$  reaction (27% yield (3)) see indic. refs.]

C is sol. in aq. 25% NaOH at 60° but on cooling seps.  $Na\bar{A}\cdot 4H_2O$ , m.p. 84-85° (1); anhydrous  $Na\bar{A}$ , m.p. 280° (1) (4) (for use in sepn. of C from the isomeric 6-chloro-2-phenylphenol (3:1757) see (1)). [For formn. of  $Na\bar{A}$  in org. solvents such as MeOH, ether, or toluene see (8).]

The calcium salt of C is more sol. in aq. than the corresp. deriv. of the isomeric 6-chloro-2-phenylphenol (3:1757) (use in sepn. (2)).

C on mononitration with  $HNO_3$  in AcOH at 15-20° as directed gives (48% yield (3)) 5-chloro-2-hydroxy-3-nitrobiphenyl, yellow ndls., m.p. 57-58° (3).

[C on condensation with formaldehyde + morpholine yields (6) a prod. m.p. 125-125° (6).]

— 4-Chloro-2-phenylphenyl benzoate: m.p. 86-87° (7). [Note that this prod. does not distinguish C from the isomeric 6-chloro-2-phenylphenol (3:1757) whose benzoate has m.p. 88.5°.]

3:0031  $\alpha$ -CHLOROACROLEIN  
(2-Chloropropen-2-al-1)

Beil. I —

I<sub>1</sub> —

I<sub>2</sub>-(785)

B.P. 40° at 30 mm. (1)

$D_4^{20} = 1.199$  (2) (3)

$n_D^{20} = 1.463$  (2) (3)

39-40° at 30 mm. (2)

$D_4^{15} = 1.205$  (3)

29-31° at 17 mm. (3)

$D_4^0 = 1.272$  (3)

Colorless strongly lachrymatory liq. with pronounced irritating effect on mucous membranes.

[For prepn. of  $\tilde{\text{C}}$  from nerolein (1:0115) in aq. with  $\text{Cl}_2$  (50% yield (2)) or from  $\alpha,\beta$ -dichloropropionaldehyde (3:9034) by loss of 1 HCl with hot aq. NaOAc (27% yield (3)) (1) see indic. refs.]

$\tilde{\text{C}}$  readily polymerizes.

[ $\tilde{\text{C}}$  in  $\text{CCl}_4$  with  $\text{Cl}_2$  in cold adds 1 mole halogen giving (2)  $\alpha,\alpha,\beta$ -trichloropropionaldehyde (3:9033).]

[ $\tilde{\text{C}}$  in dry ether with  $\text{Br}_2$  in cold adds 1 mole halogen giving (2)  $\alpha$ -chloro- $\alpha,\beta$ -dibromopropionaldehyde, b.p. 105° at 55 mm.,  $D_4^{20} = 2.17$ ,  $n_D^{20} = 1.548$ .]

[For conversion of  $\tilde{\text{C}}$  with EtOH to  $\alpha$ -chloroacrolein diethylacetal, b.p. 158-160°, see (4).]

3:9031 (1) Muskat, Becker, *J. Am. Chem. Soc.* 52, 816-817 (1930). (2) Berlande, *Bull. soc. chim.* (4) 37, 1392-1393 (1925). (3) Moureu, Robin, Boismenu, *Ann. chim.* (9) 15, 210-211 (1921). 3:0032  $d,l$ - $\alpha,\beta$ -DICHLOROPROPIONYL CHLORIDE  $\text{C}_3\text{H}_2\text{OCl}_3$  Beil. S.N. 162

B.P. 52-54° at 16 mm. (1)

$D_4^{20} = 1.4757$  (2)

$n_D^{20} = 1.47640$  (2)

43-44° at 10 mm. (2)

[For prepn. of  $\tilde{\text{C}}$  from  $\alpha,\beta$ -dichloropropionic acid (3:0855) with  $\text{SOCl}_2$  see (1) (2); for formn. of  $\tilde{\text{C}}$  from glyceric acid ( $\alpha,\beta$ -dihydroxypropionic acid) with  $\text{PCl}_5$  see (4) (3) (5).]

[ $\tilde{\text{C}}$  with alcohols yields alkyl  $\alpha,\beta$ -dichloropropionates; e.g., cf. (1) (2) (3).]

$\tilde{\text{C}}$  on hydrolysis yields  $\alpha,\beta$ -dichloropropionic acid (3:0855) q.v.

3:9032 (1) Marvel, Dec, Cooke, Cowan, *J. Am. Chem. Soc.* 62, 3495-3498 (1940). (2) Leimu, *Ber.* 70, 1016, 1050 (1937). (3) Werigo, Werner, *Ann.* 170, 163-167 (1874). (4) Werigo, Okubtch, *Ann.* 167, 49 (1873). (5) Wiechelhaus, *Ann.* 135, 253 (1865); 143, 3 (1867).

[ $\bar{C}$  with hexanone-2 directly has not been studied, but  $\bar{C}$  with *n*-butylacetylene (1:8055) in pres. of  $\text{Et}_2\text{O} \cdot \text{BF}_3 / \text{HgO} / \text{MeOH} / \text{trichloroacetic acid}$  gives (104) 4-(chloromethyl)-2-*n*-butyl-2-methyl-1,3-dioxolane, h.p.  $109^\circ$  at 25 mm.]

[ $\bar{C}$  with acetophenone (1:5515) in pres. of  $\text{H}_2\text{SO}_4$  or  $\text{HCl}$  gives (105) a prod. presumably 4-(chloromethyl)-2-methyl-2-phenyl-1,3-dioxolane, b.p.  $153\text{--}153.3^\circ$  at 40 mm., which with 2 *N*  $\text{HCl}$  at  $60^\circ$  is hydrolyzed into its original components.]

#### BEHAVIOR OF $\bar{C}$ WITH SALTS OF ORGANIC ACIDS

$\bar{C}$  reacts with salts of organic acids to give in general the corresp. glycerol  $\alpha$ -esters.

With salts of aliphatic monohasic acids. [ $\bar{C}$  with Na formate on htg is claimed to yield (106) (45) glycerol  $\alpha$ -monoformate [Beil. II-24, II<sub>1</sub>-(19), II<sub>2</sub>-(33)], but owing to the instability of this prod. the reliability of its supposed constants has been questioned (8) ]

[ $\bar{C}$  with NaOAc or KOAc in s.t. at  $150\text{--}160^\circ$  yields (107) glyceryl  $\alpha$ -acetate [Beil. II-146, II<sub>1</sub>-(69), II<sub>2</sub>-(159)], h.p.  $129\text{--}131^\circ$  at 3 mm.,  $D_4^{20} = 1.2060$ ,  $n_D^{20} = 1.4517$  (108), but the reactn. is accompanied by some formn of glyceryl diacetate and glyceryl triacetate.]

[For corresp. reactions of  $\bar{C}$  with sodium salts of *n*-butyric acid (1:1035), isobutyric acid (1:1030), *n*-valeric acid (1:1060), isovaleric acid (1:1050), and *n*-caproic acid (1:1130) see (8).]

[ $\bar{C}$  with K laurate in s.t. at  $180^\circ$  under  $\text{CO}_2$  (109) or  $\bar{C}$  with Na laurate at  $130^\circ$  (110) gives glyceryl  $\alpha$ -laurate ("  $\alpha$ -monolaurin ") [Beil. II-362, II<sub>1</sub>-(157), II<sub>2</sub>-(320)], m.p.  $63^\circ$  (111), cf. (112),  $62^\circ$  (2).]

[ $\bar{C}$  with K myristate in s.t. at  $180^\circ$  under  $\text{CO}_2$  (109), or  $\bar{C}$  with sodium myristate at  $110\text{--}115^\circ$  for 8-10 hrs. (110), gives (70% yield (110)) glyceryl  $\alpha$ -myristate ("  $\alpha$ -monomyristin ") [Beil. II-366, II<sub>1</sub>-(162), II<sub>2</sub>-(327)], m.p.  $68^\circ$  (109) (113),  $67.3^\circ$  (111) cf. (112).]

[ $\bar{C}$  with K palmitate in s.t. at  $180^\circ$  under  $\text{CO}_2$  (109), or  $\bar{C}$  with Ph palmitate at  $112^\circ$  under  $\text{CO}_2$  (113), gives (50% yield (113)) glyceryl  $\alpha$ -palmitate ("  $\alpha$ -monopalmitin ") [Beil. II-373, II<sub>2</sub>-(338)], m.p.  $74\text{--}75^\circ$  (2),  $77^\circ$  (111) cf. (112).]

[ $\bar{C}$  with K stearate in s.t. at  $180^\circ$  under  $\text{CO}_2$  (109), or  $\bar{C}$  with sodium stearate at  $110\text{--}115^\circ$  for 8-10 hrs. (110) cf. (114), gives glyceryl  $\alpha$ -stearate ("  $\alpha$ -monostearin "), m.p.  $81.1^\circ$  (111) cf. (112).]

With salts of amino acids. [For analogous formn. of corresp. glyceryl mono esters from  $\bar{C}$  with sodium salts of aminoacetic acid (glycine) (115),  $\alpha$ -aminopropionic acid (alanine) (115),  $\alpha$ -amino-isocaproic acid (leucine) (116) see indic. refs ]

With alkali cyanides. [ $\bar{C}$  in 95% alc. with aq. KCN (or NaCN) in s.t. at  $100^\circ$  for 36 hrs., followed by hydrolysis, gives (9) 28% yield of the lactone of  $\beta,\gamma$ -dihydroxy-*n*-butyric acid ( $\beta$ -hydroxy-*n*-butyro- $\gamma$ -lactone), m.p.  $22.5\text{--}26^\circ$  (9), accompanied by (23% yield (9)) the lactone of  $\gamma$ -hydroxyisocrotonic acid, m.p.  $+5^\circ$  (9) (presumably formed by loss of  $\text{H}_2\text{O}$  from the former).] Cf. behavior of " glycerol  $\beta$ -monochlorohydrin " (3:9039).

#### BEHAVIOR OF $\bar{C}$ WITH OTHER NON-NITROGENOUS ORGANIC REACTANTS

With alkyl halides (or their equivalents). [ $\bar{C}$  with MeI + silver oxide (15), or  $\bar{C}$  with methyl *p*-toluenesulfonate at  $150^\circ$  for 5 hrs. (117), or  $\bar{C}$  with diazomethane (118) gives the corresp. dimethyl ether, viz., 3-chloro-1,2-diethoxypropane, h.p.  $156\text{--}157^\circ$  at 760 mm. (117),  $156\text{--}158^\circ$  (118),  $156^\circ$  (15),  $D_4^{25} = 1.08$  (15),  $n_D^{25} = 1.43$  (15).]

[Note that the corresp. diethyl ether, viz., 3-chloro-1,2-diethoxypropane, h.p.  $69.8\text{--}70.4^\circ$  at 14 mm.,  $D_4^{10} = 1.026$ ,  $n_D^{20} = 1.4246$ , has been prepd. indirectly (119).]

With  $\text{RMgX}$  cpds. [ $\bar{C}$  with  $\text{EtMgBr}$  (2 moles) reacts in an obscure fashion yielding (119) (45) 5455). —  $\bar{C}$  with *iso*- $\text{AmMgBr}$  (4 moles) (perhaps acting as (25% yield (120)) 2,5-dimethylhexanediol-1,2 [Beil. II-373, II<sub>2</sub>-(338)],  $129\text{--}132^\circ$  at 11 mm.]

[ $\bar{C}$  with  $C_6H_5MgBr$  (4 moles) (perhaps acting through intermediate acetol) gives (120) (121) (60% yield (120)) 2-phenylpropanediol-1,2 [Beil. VI-930] accompanied by some 3-phenylpropanediol-1,2 [Beil. VI-929].]

#### BEHAVIOR OF $\bar{C}$ WITH AMINES

With primary amines. *With aliphatic primary amines.* [ $\bar{C}$  with *n*-heptadecylamine (122) or its hydrochloride gives a prod. which may be the expected *N*-( $\beta,\gamma$ -dihydroxy-*n*-propyl)*n*-heptadecylamine.]

*With aromatic primary amines.* [ $\bar{C}$  with aniline (2 moles) + a little aq. refluxed for 1 hr., then neutralized, gives (63% yield (124)) *N*-( $\beta,\gamma$ -dihydroxy-*n*-propyl)aniline [Beil. XII-183], b p. 249–250° at 50 mm. (125), 200–203° (124), m p. 42° (124), 52° (125).]

[ $\bar{C}$  with *p*-aminophenol gives (126) *N*-( $\beta,\gamma$ -dihydroxy-*n*-propyl)-*p*-aminophenol, m.p. 192°, used as photographic developer (127); for analogous reactions of  $\bar{C}$  with *p*-anisidine giving *N*-( $\beta,\gamma$ -dihydroxy-*n*-propyl)-*p*-anisidine, m.p. 75–76° see (126), or of  $\bar{C}$  with *p*-phenetidine giving *N*-( $\beta,\gamma$ -dihydroxy-*n*-propyl)-*p*-phenetidine, m.p. 93° (126), 90–92° (128), see indic. refs.]

With secondary amines. *With aliphatic secondary amines* [ $\bar{C}$  with  $Me_2NH$  + aq. NaOH at 20–40° (129) or  $\bar{C}$  with  $Me_2NH$  in s.t. at 100° for 5–6 hrs. (130) (131) cf. (132) gives 3-(dimethylamino)propanediol-1,2 [Beil. IV-302], h.p. 220° cor. at 749 mm. (130), 111° at 15 mm. (132) —  $\bar{C}$  with  $Et_2NH$  in s.t. at 100° for 5–6 hrs. (131) cf. (130) (132) gives 3-(diethylamino)propanediol-1,2 [Beil. IV-302], b p. 233–235° at 748 mm (130) (131), 106° at 3 mm. (132) (corresp. bis-(*N*-phenylcarbamate), m.p. 106.5° (133); corresp. bis-(*N*-phenylcarbamate)monohydrochloride, m.p. 109° (133)).]

*With heterocyclic secondary amines* [ $\bar{C}$  with piperidine in s.t. at 100° for 4–5 hrs. (131, cf. (132) or in ord. flask at 100° for 1½ hrs. (134) gives 3-(piperidino)propanediol-1,2 [Beil. XX-34, XX-1-(12)], m.p. 83° (135) (132), 79–80° (136), 67–68° (134) (corresp. bis-(*p*-nitrobenzoate), m.p. 108° (135); corresp. bis-(*N*-phenylcarbamate)monohydrochloride ("Diothane"), m.p. 201–202° cor. (137), 197–198° u.c. (?) (133)). — Note that in prepn. of "Diothane" the influence of the purity of the piperidine has been studied (137); that 3-(piperidino)propanediol-1,2 yields a *mono*-(*N*-phenylcarbamate)monohydrochloride, m.p. 176–177° (133); for resolution of *d,l*-3-(piperidino)propanediol-1,2 into its opt. act. enantiomorphs and prepn. of the corresp. opt. act. "Diothanes" see (138) ]

With tertiary amines. [ $\bar{C}$  with  $Me_3N$  anhydrous (139) or in aq. soln. in s.t. at 100° for 8 hrs. (31) or in alc. soln. in s.t. at 100° for 6 hrs. (140) gives trimethyl-( $\beta,\gamma$ -dihydroxy-*n*-propyl)-ammonium chloride [Beil. IV-302]. —  $\bar{C}$  with  $Et_3N$  in s.t. at 100° for 8 hrs. gives (141) triethyl-( $\beta,\gamma$ -dihydroxy-*n*-propyl)-ammonium chloride [Beil. IV-303]. — For analogous behavior of  $\bar{C}$  with tri-*n*-propylamine, quinine, and strychnine see (141). — For quat. salt from  $\bar{C}$  with *N,N*-dimethyl "stenyl" amine see (142).]

#### BEHAVIOR OF $\bar{C}$ WITH OTHER NITROGENOUS ORG. REACTANTS

[ $\bar{C}$  with diazomethane gives (118) the corresp. dimethyl ether for which see above under behavior of  $\bar{C}$  with alkyl halides.]

[ $\bar{C}$  with aq.  $Na_2NCN$  stood for 12 hrs., then shaken with benzoyl chloride, gives (143) the trihenzoate, m.p. 130° of 5-(hydroxymethyl)-2-aminooxazoline; substitution of benzenesulfonyl chloride for the benzoyl chloride yields (144) corresp. *tris*-(benzenesulfonate), m.p. 158°.] Cf. behavior of epichlorohydrin (3:5358).

— Glycerol  $\alpha$ -monochlorohydrin  $\alpha'$ -acetate ( $\gamma$ -chloro- $\beta$ -hydroxy-*n*-propyl acetate): h.p. 240° (see 3:6775).

- Glycerol  $\alpha$ -monochlorohydrin  $\beta$ -acetate ( $\beta$ -chloro- $\beta'$ -hydroxy-isopropyl acetate): b.p. 218° (see 3:6517).
- Glycerol  $\alpha$ -monochlorohydrin  $\alpha,\beta$ -diacetate: b.p. 245° (see 3:6840).
- Glycerol  $\alpha$ -monochlorohydrin  $\alpha'$ -benzoate: unreported.
- Glycerol  $\alpha$ -monochlorohydrin  $\beta$ -benzoate: unreported.
- Glycerol  $\alpha$ -monochlorohydrin  $\alpha',\beta$ -dibenzoate: unreported.
- ① Glycerol  $\alpha$ -monochlorohydrin di-( $p$ -nitrobenzoate): m.p. 108–109° u.c. (14), 108° (15), 107–108° (2). [From  $\bar{C}$  with  $p$ -nitrobenzoyl chloride (2 moles) in pyridine at room temp. for several days (93–96% yield (14)) or in  $\text{CHCl}_3$  soln. with quinoline as acid acceptor (100% yield (2)); note that this prod. depresses m.p. (121–122°) of the corresp. deriv. of the isomeric glycerol  $\beta$ -monochlorohydrin (3:9039) (14).]
- Glycerol  $\alpha$ -monochlorohydrin  $\alpha'$ -(?)-(N-phenylcarbamate): m.p. 123–129° (16), 127–129° (9), 126° (42). [From  $\bar{C}$  with phenyl isocyanate in 7% yield (9); note that for the corresp. deriv. of glycerol  $\beta$ -monochlorohydrin (3:9039) the m.p. is 133–136°.]
- ① N-( $\beta,\gamma$ -dihydroxy-n-propyl)phthalimide: m.p. 111.5–112.5° (145), 111° (46). [From  $\bar{C}$  with K phthalimide (100% yield (46)), but no details of conditions are stated.]

[For prepn. of  $\bar{C}$  from 1,1,1-trichloropropanone-2 (3:5020) by reduction with fused  $Al(OEt)_3$  in abs. alc. under  $H_2$  or  $N_2$  (8) or with  $AlEt_3$  etherate in ether (3) (yields: 67% (8), 65% (3)) see indic. refs.; for prepn. of  $\bar{C}$  from chloral (3:5210) with  $CH_3MgBr$  (9) (19) (2) cf. (4) or  $MeMgI$  (2) cf. (4) (yield: 40% (9) (2)) see indic. refs. (note that by this method the normal addn. of  $RMgX$  leading to  $\bar{C}$  is accompanied by reduction leading to 2,2,2-trichloroethanol (3:5775) and the relative proportion of these two reactions is profoundly influenced by the pres. of metal salts (9)); for prepn. of  $\bar{C}$  from chloral (3:5210) with  $ZnMe_2$  see (6) ]

$\bar{C}$  is used as hypnotic pharmaceutical under the trade name "Isopral" (10), for use as seed disinfectant see (11); for study of disinfectant power and toxicity see (12); for comparative study of narcotic action see (13) — For study of tests for  $\bar{C}$  see (7) (14).

$\bar{C}$  on reduction in aq.  $AcOH$  +  $Zn$  dust in cold yields (15) 1,1-dichloropropene-1 (3:5120).  $\bar{C}$  on oxidn. with fuming  $HNO_3$  under reflux for 5 hrs. gives (2) trichloroacetic acid (3:1150); use of  $K_2Cr_2O_7$  +  $H_2SO_4$  gives only insignificant yields (2) while less strong  $HNO_3$  even after 4 hrs. at  $100^\circ$  has only slight action (2).

$\bar{C}$  with  $P_2O_5$  on htg. loses  $H_2O$  giving (84% yield (19)) (2) 1,1,1-trichloropropene-2 (3:5345), b.p.  $114-115^\circ$  at 757 mm. (2).

[ $\bar{C}$  with  $HNO_3/H_2SO_4$  mixt. yields (2)  $\beta,\beta,\beta$ -trichloroisopropyl nitrate, oil,  $D_{15}^{20} = 1.499$ ,  $n_D^{20} = 1.47892$ , but decomp. on htg. —  $\bar{C}$  with  $PCl_3$  or  $PCl_5$  yields (2) (1) various partial ester/acid chloride derivs. of phosphorous or phosphoric acids —  $\bar{C}$  with  $SOCl_2$  evolves  $HCl$  +  $SO_2$  and also yields (2) a liq. presumably  $\beta,\beta,\beta$ -trichloroisopropyl chlorosulfonate.]

$\bar{C}$  with aq. or alc.  $NaOH$  or conc. aq.  $Na_2CO_3$  gives on htg. (16) (17) mainly acetaldehyde (1:0100) and lactic acid (1:0400), also accompanied by formic acid (1:1005) and carbon monoxide; for use of this reactn. in detection of  $\bar{C}$  see (14) —  $\bar{C}$  with  $EtOH/NaOEt$  on htg. gives (15) ethyl  $\alpha$ -ethoxypropionate [Bul. III-280, III-1(109), III-2(206)], b.p.  $155^\circ$  cor. at 760 mm.,  $D_4^{20} = 0.9446$ ,  $n_D^{20} = 1.40125$ .

[ $\bar{C}$  with  $AcCl$  yields (2)  $\beta,\beta,\beta$ -trichloroisopropyl acetate, b.p.  $180-181^\circ$  cor. 766 mm., m.p. +  $8^\circ$ ,  $D_{15}^{20} = 1.353$ ,  $n_D^{20} = 1.46017$  (2).]

—  $\beta,\beta,\beta$ -Trichloroisopropyl carbamate: cryst. from  $C_6H_6$ , m.p.  $125^\circ$  (18). Prepd. indirectly from  $\beta,\beta,\beta$ -trichloroisopropoxy  $MgBr$  with phosgene in toluene, followed by treatment with  $NH_3$  (35% yield (18)).]

1.3217 (3)

cf. (4)

$D_4^0 = 1.3416$

1.3375 (3)

Attention is directed to the fact that  $\bar{C}$  is in most respects extremely similar in physical constants and chemical behavior to the isomeric glycerol  $\alpha$ -monochlorohydrin (3-chloropropanediol-1,2) (3:9038); that  $\bar{C}$  is very readily partially isomerized to the latter, and that, therefore, the homogeneity of all preps. of  $\bar{C}$  or reactn. prods. derived from supposedly pure  $\bar{C}$  must be accepted with reserve. The literature of the two glycerol monochlorohydrins is seriously entangled, and reference to the original articles must be made for supporting details.

### PREPARATION OF $\bar{C}$

$\bar{C}$  has been isolated (3) from the mixed glycerol monochlorohydrins by fractional hydrolysis and distillation; this isolation has been confirmed (4) (6) by methods based on the slower condensation of  $\bar{C}$  with acetone (see below). — The mixture of glycerol monochlorohydrins obtd. from glycerol (1:6540) with conc. HCl at 120° for 5 hrs. under press. contains (4) 13%  $\bar{C}$ .

## 3:9040 1,4-DICHLOROBUTADI-1,3

(Dichlorohiacetylene)

Beil. I —

I<sub>1</sub>—I<sub>2</sub>-(246)

M.P. 1-3° (1)

Long colorless ndls., which can be distilled under N<sub>2</sub> yielding a colorless oil (1). —  $\bar{\text{C}}$  has odor of dichloroacetylene; readily polymerizes to an insol. dark brown explosive material. —  $\bar{\text{C}}$  explodes at 73° (1).

[For prepn. of  $\bar{\text{C}}$  from diacetylene [Beil. I-266] by actn. of alk. hypochlorite soln. in cold and absence of light see (1) (2) (3).]

$\bar{\text{C}}$  dislvd. in  $\text{CHCl}_3$  and stood 1 day with I<sub>2</sub> in  $\text{CHCl}_3$  adds 2 moles I<sub>2</sub> yielding (1) 1,4-dichloro-1,2,3,4-tetraiodobutadiene-1,3, which after careful recrystn. from  $\text{C}_6\text{H}_6$ /pet. ether has m.p. 155-157° (1).

3:9040 (1) Straus, Kollek, Hauptmann, *Ber.* 63, 1893-1894 (1930). (2) I.G., Brit. 333,946, Sept. 18, 1930; *Cent.* 1931, I 523. (3) I.G., Ger. 495,787, April 17, 1930.

## 3:9044 1,1,2,3,4-PENTACHLOROBUTADIENE-1,3

C<sub>4</sub>HCl<sub>5</sub>

Beil. I - 250

I<sub>1</sub>—I<sub>2</sub>-(225)

B.P. 125° at 70-80 mm. (1)

[From 2,3,4,5,5-pentachloropentadien-2,4-oic acid-1 [Beil. II-482] by hoilg. with aq., then distilling with steam; the structure of the acid (and therefore of  $\bar{\text{C}}$ ) is disputed (2). — For two other materials (b.p. 193-200° at 720 mm.) having the composition C<sub>4</sub>HCl<sub>5</sub>, obtd. from trichloroethylene (3:5170) with AlCl<sub>3</sub>, hut thought *not* to be identical with  $\bar{\text{C}}$ , see (3).]

3:9044 (1) Zincke, Kuster, *Ber.* 26, 2113 (1893). (2) Zincke, *Ann.* 296, 143 (1897). (3) Kaufner, *Ann.* 433, 48-51 (1923).

## 3:9046 1,1,2,3,4,4-HEXACHLOROBUTENE-2

(Liquid stereoisomer)

C<sub>4</sub>H<sub>2</sub>Cl<sub>6</sub>

Beil. S.N. 11

B.P. 07-98° at 10 mm. (1)

 $D_{15}^{15} = 1.651$  (1)  $n_D^{20} = 1.53313$  (1)

[See also solid stereoisomer (3:1945).]

Colorless oily liq. with agreeable odor.

[For formn. of  $\bar{\text{C}}$  (together with its solid stereoisomer (3:1945)) by actn. of Cl<sub>2</sub> upon the high-boilg. fraction obtd. in the prepn. of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1); for formn. of  $\bar{\text{C}}$  from the liq. stereoisomer (3:6150) of 1,2,3,4-tetrachlorobutadiene-1,3 + Cl<sub>2</sub> see (1).]

3:9046 (1) Müller, Hüther, *Ber.* 64, 589-600 (1931); *C.A.* 25, 3956-3957 (1931).

[For formn. of  $\bar{C}$  (together with the isomeric  $\alpha$ -monochlorohydrin) from a mixt. of monochlorohydrin diacetates with abs. MeOH contg. dry HCl gas see (7).]

[The mixture of the two glycerol monochlorohydrins obt'd. from allyl alcohol (1:6145) by addn. of HOCl (1) (8) (5) cf. (6) (9) (10) (11) (13) or from epichlorohydrin (3:5358) q.v. by addn. of aq. in pres. of acids has been shown (12) to be essentially similar to that obt'd. from glycerol with HCl, although different proportions of  $\alpha$ - and  $\beta$ - isomers might be anticipated (3).]

### CHEMICAL BEHAVIOR OF $\bar{C}$

Reduction of  $\bar{C}$ . [ $\bar{C}$  with Na/Hg in aq. alc. HCl gives (8) trimethylene glycol (1:6490).]

Behavior with aq. alkalis. [ $\bar{C}$  with aq. alk. loses HCl and ring-closes to 3-hydroxy-1,2-epoxypropane (glycidol = epihydrin alcohol): this reactn. occurs with  $\bar{C}$  very much more slowly than for the isomeric  $\alpha$ -monochlorohydrin (3:9038); for its use in detn. of purity of  $\bar{C}$  see (6) (3) (13) (14).]

Behavior with alkali cyanides. [ $\bar{C}$  in 95% alc. with aq. KCN (or NaCN) in s.t. at 100° for 36 hrs., followed by hydrolysis, does *not* (6) give the expected  $\beta,\beta'$ -dihydroxyisobutyric acid but instead gives (35% yield (6)) the lactone of  $\beta,\gamma$ -dihydroxy-*n*-butyric acid ( $\beta$ -hydroxy-*n*-butyro- $\gamma$ -lactone), m.p. 22.5–26° (6), i.e., the same prod. similarly obt'd. from glycerol  $\alpha$ -monochlorohydrin (3:9038).]

Behavior with NaI. [ $\bar{C}$  with dry NaI in anhydrous acetone in s.t. at 100° for 12 hrs. gives (18% yield (15)) glycerol  $\beta$ -mono-iodohydrin, m.p. 52–53° (15).]

Behavior with acetone. [ $\bar{C}$  in acetone with  $P_2O_5$  at 2–7° gives (57% yield (4)) a condensation prod., "acetone- $\beta$ -chlorohydrin,"  $C_6H_{11}O_2Cl$ , h.p. 161.5–162.2° cor. at 757 mm.,  $D_4^{25} = 1.1344$ ,  $n_D^{25} = 1.4487$ , this condensation occurs less readily, however, than the analogous reactn. for glycerol  $\alpha$ -monochlorohydrin (3:9038), and removal of the latter by this means has been used (4) to enrich the proportion of  $\bar{C}$  in a mixt. of the two.]

— Glycerol  $\beta$ -monochlorohydrin  $\alpha$ -acetate: oil, b.p. 230° at 760 mm., 230–234° cor. at 750 mm. (10),  $D_4^{25} = 1.235$  (10). (See 3:6648.)

— Glycerol  $\beta$ -monochlorohydrin  $\alpha,\alpha'$ -diacetate: oil, h.p. 101–102° at 4 mm. (15).

— Glycerol  $\beta$ -monochlorohydrin  $\alpha$ -benzoate: unreported.

— Glycerol  $\beta$ -monochlorohydrin  $\alpha,\alpha'$ -dibenzoate: oil, h.p. 210–211° at 1.5 mm. (15).

— Glycerol  $\beta$ -monochlorohydrin  $\alpha,\alpha'$ -bis-(*p*-nitrobenzoate): m.p. 121–122° (16) (7).

[Prepd. indirectly; note that this prod. depresses the m.p. of authentic glycerol  $\alpha$ -monochlorohydrin bis-(*p*-nitrobenzoate), m.p. 108–109° u.c. (7).]

— Glycerol  $\beta$ -monochlorohydrin  $\alpha$ -(*N*-phenylcarbamate): m.p. 133–136° (6), 131–133° remelting at 133° (12). [From  $\bar{C}$  with phenyl isocyanate in 6% yield (6); note that, for the corresp. deriv. of glycerol  $\alpha$ -monochlorohydrin, m.p. is 128–129° (12).]

07 (1943).  
Chem. 92,  
133, *J. Am.*

$\bar{C}$  is volatile with steam (use in sepn. from accompanying resin (1)).

$\bar{C}$  reduces Tollens' soln. but not  $\text{NH}_4\text{OH}/\text{AgNO}_3$  without alkali (1).

$\bar{C}$  is not attacked by boilg. 0.1%  $\text{KMnO}_4$  (1).

$\bar{C}$  on boilg. with excess  $N/10$  alc.  $\text{KOH}$  splits off 2.34-2.6 moles  $\text{HCl}$  but  $\bar{C}$  cannot be titrated (1).

## 3:9098 ACETOACETYL CHLORIDE

(β-Keto-n-butyryl chloride)

This compound cannot be preserved at temperatures above  $-20^\circ$  (1) cf. (4); m.p.  $-50$  to  $-51^\circ$  (1).

[For prepn. of  $\bar{\text{C}}$  from acetylketene (ketene dimer) (2) (3) (5) with dry HCl gas at  $-7$  to  $-50^\circ$  see (1).] [For anal. of  $\bar{\text{C}}$  by reactn. with dil. alk. see (1).]

$\bar{\text{C}}$  on warming to room temp. undergoes bimolecular condensation with elimination of 2 HCl and yields (1) dehydroacetic acid (1:0700), m.p.  $109^\circ$ .

$\bar{\text{C}}$  in dry ether at  $-60^\circ$  treated with abs. EtOH gives (27% yield (1)) ethyl acetoacetate (1:1710).

$\bar{\text{C}}$  in dry ether at  $-50^\circ$  treated with aniline gives (49% yield (1)) acetoacetanilide [Beil. VII 519 VII (1975) m.p.  $85^\circ$ ; note, however, that  $\bar{\text{C}}$  with aniline at room temp. yields

acid-3 (1-phenyllutidonecarboxylic acid-3) Eq. calcd. 243, found 235 (1).

$\bar{\text{C}}$  with  $\text{C}_6\text{H}_6 + \text{AlCl}_3$  or with  $\text{C}_6\text{H}_5\text{MgBr}$  in ether at  $-50^\circ$  gives (27% and 12% yield respectively (1)) benzoylacetone (1:1450), m.p.  $59^\circ$  (1).

3:9098 (1) Hurd, Kelso, *J. Am. Chem. Soc.* 62, 1548-1549 (1940). (2) Hurd, Abernathy, *J. Am. Chem. Soc.* 62, 1147-1148 (1940). (3) Hurd, Williams, *J. Am. Chem. Soc.* 58, 962-968 (1936). (4) Staudinger, Scholtz, *Ber.* 53, 1109 Note 1 (1920). (5) Boese, *Ind. Eng. Chem.* 32, 16-22 (1940).

## 3:9098-A METHYL (CHLOROFORMYL)ACETATE

(Carbomethoxyacetyl chloride)

B.P.  $57-59^\circ$  at 12 mm. (1)

[See also ethyl (chloroformyl)acetate (3:9246).]

Note that  $\bar{\text{C}}$  is both an acid chloride and an ester; it comprises the half acid chloride/half methyl ester of malonic acid (1:0480).

[For prepn. of  $\bar{\text{C}}$  from potassium salt of methyl hydrogen malonate with  $\text{SOCl}_2$  in dry ether (68% yield) see (1).]

$\bar{\text{C}}$  on htg. or on repeated distn. or by action of quinoline in dry ether at  $0^\circ$  loses HCl and undergoes condensation to methyl 6-methoxy-2,4-diketo-2,3-dihydropyran-3-carboxylate [Beil. XVIII<sub>1</sub>-(540)], ndls. from  $\text{CHCl}_3$ , m.p.  $143-150^\circ$  (1) cf. (2).

• ①  $\omega$ -(Carbomethoxyacet)anilide: ndls. from ether/pet. eth., m.p. 42-43° (1). [From  $\bar{C}$  with aniline (1).]

—  $\omega$ -(Carbomethoxyacet)-*p*-toluidide: unreported.

3:9098-A (1) Staudinger, Becker, *Ber.* 50, 1019-1020 (1917). (2) Leuchs, *Ber.* 39, 2643 (1906).

3:9099  $\beta$ -HYDROXYETHYL HOCH<sub>2</sub>CH<sub>2</sub>-O-CO.CCl<sub>3</sub> C<sub>4</sub>H<sub>5</sub>O<sub>3</sub>Cl<sub>3</sub> Beil. S.N. 160  
TRICHLOROACETATE 2691

(2-Hydroxy-2-(trichloromethyl)-1,3-dioxolane)

B.P. 130-140° at 12 mm. (1)  $n_D^{25} = 1.4762$  (3)  
89° at 1.75 mm. (2)  
83° at 0.8 mm. (2)  $D_4^{20} = 1.532$   $n_D^{20} = 1.48378$  (2)  
68° at 0.025 mm. (3) 1.4775 (3)

Note that  $\bar{C}$  may react either in the ester form (A) or the dioxolane form (B) and doubtless exists as a tautomeric equilibrium of both; in this equilibrium, however, form (A) probably predominates (2), but variations in the equilibrium may account for the observed variation in  $n_D^{20}$  (see above).

Colorless odorless oil, spar. sol. aq. (2). —  $\bar{C}$  on long stdg. is claimed (2) to disproportionate to ethylene glycol bis-(trichloroacetate) (not, however, otherwise described in the literature) and ethylene glycol (1:6465). —  $\bar{C}$  on attempted distn at usual water-pump vac. (14-17 mm.) (3) or  $\bar{C}$  in presence of a trace of pyridine (3) decomposes yielding monomeric ethylene glycol carbonate [Beil. XIX-100], m.p. 38°, and CHCl<sub>3</sub> (3:5050).

[For prepn. of  $\bar{C}$  from ethylene glycol (1:6465) with trichloroacetyl chloride (3:5420) in 1,4-dioxane soln. (82% yield (2)) or from ethylene oxide (1:6105) with trichloroacetic acid (3:1150) (28% yield based on latter (1) (3)) see indic. refs.]

$\bar{C}$  on shaking with aq. and simultaneously titrating with *N*/10 aq. NaOH hydrolyzes to ethylene glycol (1:6465) and trichloroacetic acid (3:1150) as shown by Sap. Eq. of 207.8 (2) (calcd. 207.5).

[ $\bar{C}$  with diazomethane (1) best in CCl<sub>4</sub> soln. (2) gives (yields: 78% (2), 39% (1)) the methyl ether corresp. to structure (B), viz., 2-methoxy-2-(trichloromethyl)-1,3-dioxolane, pr. tbs. from alc., m.p. 78-78.5° (1), 77-78° (2) (4), b.p. 114-115° at 12 mm. (4), 112-113° at 10 mm. (1); this product although resistant to saponification by alkalis is hydrolyzed by dil. acids (4). — Note that the isomeric methyl ether corresponding to structure (A), viz.,  $\beta$ -methoxyethyl trichloroacetate, although not obtainable from  $\bar{C}$ , has nevertheless been prepd. (82% yield (4)) from  $\beta$ -methoxyethanol (methyl "cellosolve") (1:6405) with trichloroacetyl chloride (3:5420), has quite different physical props., viz., m.p. 14-14.8° (4), b.p. 92-93° at 10 mm. (4), and is easily hydrolyzed (4) on sbaking with aq. alone to  $\beta$ -methoxyethanol (1:6405) and trichloroacetic acid (3:1150). — Note also that the first of the above two methyl ethers, i.e., 2-methoxy-2-(trichloromethyl)-1,3-dioxolane, by trans-esterification with alcohols (e.g., EtOH (2), *n*-PrOH (4), *n*-BuOH (2)) can be converted to its higher homologs.]

$\bar{C}$  with acid chlorides gives esters corresp. to the acyclic structure (A): e.g.,  $\bar{C}$  with AcCl (3:7065) gives (71% yield (4)) the mixed ester, ethylene glycol acetate-trichloroacetate ( $\beta$ -acetoxyethyl trichloroacetate) b.p. 122° at 11 mm. (4);  $\bar{C}$  with SOCl<sub>2</sub> gives (70% yield (4))  $\beta$ -chloroethyl trichloroacetate (3:6519).

3:9103 METHYL *d,l*- $\alpha,\beta$ -DICHLOROPROPIONATE $C_4H_6O_2Cl_2$ 

Beil. S.N. 162

B.P. 72-75° at 21 mm. (1)

[For prepn. of  $\bar{C}$  from technical methyl acrylate (1:3025) in MeOH soln. below 40° by treatment with  $\text{Cl}_2$  (85% yield) see (1).]

:9107  $\beta$ -HYDROXYETHYL DICHLOROACETATE  $C_4H_5O_3Cl_2$  (A) Beil. S.N. 160  
(2-Hydroxy-2-(dichloromethyl)-1,3-dioxolane) (B) Beil. S.N. 2691

(A)

(B)

B.P. 106° at 0.08 mm. (1) (3)  
82° at 0.5 mm. (2)  
81-82° at 0.5 mm. (2)

$D_4^{20} = 1.438$  (2)  
1.429 (2)

$n_D^{25} = 1.4730$  (1)  
 $n_D^{23} = 1.4743$  (3)  
 $n_D^{20} = 1.47345$  (2)  
1.47253 (2)

Note that  $\bar{C}$  may react either in the acyclic ester form (A) or the dioxolane form (B) and doubtless exists as a tautomeric equilibrium of both; in such an equilibrium, however, form (A) greatly predominates (2); but variations may account for the variation in constants (see above).

Colorless oil, spar. sol. aq. —  $\bar{C}$  on long stdg. is claimed (2) to disproportionate to ethylene glycol bis-(dichloroacetate) (not, however, further described in the literature) and ethylene glycol (1:6465).

[For prepn. of  $\bar{C}$  from ethylene glycol (1:6465) with dichloroacetyl chloride (3:5290) in 1,4-dioxane soln. (75% yield (2)) or from ethylene oxide (1:6105) with dichloroacetic acid (3:6208) (yields: 34% (2), 15% (1)) see indic. refs.]

$\bar{C}$  on shaking with aq. and simultaneously titrating with  $N/10$  aq. NaOH hydrolyzes to ethylene glycol (1:6465) and dichloroacetic acid (3:6208) as shown by Sap. Eq. of 170.8 (2) (calcd. 173).

[ $\bar{C}$  with diazomethane gives not only the methyl ethers of both forms (A) and (B) but also other unexpected products including ethylene glycol (1:6465), ethylene glycol dimethyl ether (1:6141), methyl dichloroacetate (3:5655), etc. Note that the methyl ether of structure (B), viz., 2-methoxy-2-(dichloromethyl)-1,3-dioxolane, has b.p. 91-92.5° at 9 mm. (2),  $D_4^{20} = 1.387$  (2),  $n_D^{20} = 1.47032$ , and is stable to aq. alk.; that corresp. to the acyclic structure (A), viz.,  $\beta$ -methoxyethyl dichloroacetate (methyl-"cellosolve" dichloroacetate), best prepared (100% yield (2)) from  $\beta$ -methoxyethanol (1:6405) with dichloroacetyl chloride (3:5290) in  $CHCl_3$ , has h.p. 55-56° at 0.5 mm. (2),  $D_4^{20} = 1.309$  (2),  $n_D^{20} = 1.45157$  (2).]

### PREPARATION

From chloral. [For prepn. of  $\bar{C}$  from chloral (3:5210) with EtOH (1:6130) (yields: 100% (11), 71.3% with 95% EtOH refluxed 2 hrs (4) (9) (12)) see indic. refs.; for influence of solvents see (13) (14); for formn. of  $\bar{C}$  from chloral (3:5210) + AcH + Al(OEt)<sub>3</sub> see (8).]

From chloral hydrate. [For prepn. of  $\bar{C}$  from chloral hydrate (3:1270) with EtOH (1:6130) (yield: 75% in 60 min., 38% in 24 hrs. reflux (4)), with triethyl orthoformate (1:3241) (25% yield in 105 min. reflux (4)), or with tetraethyl orthosilicate (4% yield in 4 hrs. reflux (4)) see indic. refs.]

From ethyl alcohol. [For formn. of  $\bar{C}$  as end prod. of reaction of ethyl alcohol (1:6130) with Cl<sub>2</sub> see (15).]

### PHYSICAL PROPERTIES

$\bar{C}$  is less sol. in aq. than chloral hydrate (3:1270) (6) (7). — [For study of toxicity of  $\bar{C}$  as compared with chloral hydrate (3:1270) see (29).]

### CHEMICAL BEHAVIOR

Dissociation.  $\bar{C}$  on distillation (7) or in some solns. in org. solvents cf. (17) (2) (18) is partially dissociated into chloral (3:5210) and EtOH (1:6130).

#### BEHAVIOR WITH INORGANIC REACTANTS

With H<sub>2</sub>SO<sub>4</sub>.  $\bar{C}$  with cold conc. H<sub>2</sub>SO<sub>4</sub> yields (1) chloral (3:5210) (or its polymerization products) and EtHSO<sub>4</sub>.

With aq. alkali.  $\bar{C}$  with aq. alkali gives (6) CHCl<sub>3</sub> (3:5050) + salts of formic acid (1:1005).

With chlorine. [ $\bar{C}$  with Cl<sub>2</sub> at 80° gives (19) trichloroacetaldehyde diethylacetal (3:6317).]

With PCl<sub>5</sub>. [ $\bar{C}$  with PCl<sub>5</sub> in ether below 20° (20) (4) cf. (21) (22) gives (yields: 55-74% (20), 25-33% (11))  $\alpha,\beta,\beta,\beta$ -tetrachloroethyl ethyl ether [Beil. I-623, I<sub>2</sub>-(681)], b.p. 189.7° at 758.7 mm. (21), 189.4° at 749.1 mm. cor. (20), 184° at 738 mm. (4), 79° at 16 mm. (20);  $D_4^{25} = 1.4225$  (20).]

#### BEHAVIOR WITH ORGANIC REACTANTS

With other alcohols. [ $\bar{C}$  with other alcohols may undergo an exchange of alkyl radicals; for studies of such interchange see (4) (21).]

[For prepn. of  $\bar{C}$  from either the low-boilg. (3:5360) or high-boilg. (3:5615) stereoisomers of 1,2-dichlorobutene-2 (together with 2-chlorobutene-2-ol-1 (3:8240)) by hydrolysis with 2 pts. aq. + 1 mole  $\text{CaCO}_3$  for 4 hrs. at  $70^\circ$  see (1); note that  $\bar{C}$  is formed by virtue of allylic transposition during the process and that *Cent.* and *C.A.* do not agree on the boilg. pt. (orig. inaccessible).

3:0870 1,2,3,4-TETRACHLOROBUTADIENE-1,3  $C_4H_2Cl_4$  Bell. S.N. 12  
(Solid stereoisomer)

M.P.  $50^\circ$  (1)

[See also the liquid stereoisomer (3:6150).]

[For isolation of  $\bar{C}$  from the high-boilg. fractn. resulting in the preparation of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1).]

$\bar{C}$  adds  $Cl_2$  (although much more slowly than its liquid stereoisomer) yielding 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), m.p.  $80^\circ$  (1). [This product with Zn/Cu couple in hot alc. regenerates  $\bar{C}$ , but in alc. with  $Ca(OH)_2$  or with alk. at room temp. gives the liquid stereoisomer (3:9046) (1).]

$\bar{C}$  in  $CHCl_3$  treated with  $Br_2$  gives (100% yield (1)) 1,2-dibromo-1,2,3,4-tetrachlorobutene-2, m.p.  $105^\circ$  (1). [This prod. with Zn/Cu couple in hot alc. regenerates  $\bar{C}$  (1).]

3:0870 (1) Müller, Hüther, *Ber.* 64, 589-600 (1931); *C.A.* 25, 3956 (1931).

oxalic acid see (1); for formn. of  $\bar{C}$  (together with other products) from 2-methylbutene-1 (1:8210) by actn. of  $Cl_2$  see (2).]

[For behavior of  $\bar{C}$  with NaI in acetone see (2); for use in prepn. of unsatd. cellulose ethers see (3).]

$\bar{C}$  with  $O_3$  followed by hydrolysis yields (2) chloromethyl ethyl ketone (3:8012).

3:9268 1-CHLOROPENTANONE-3  
 (β-Chloroethyl ethyl ketone)

Beil. I-680

I<sub>1</sub>—  
 I<sub>2</sub>—

B.P. 68° at 20 mm. (1)

48-56° at 13 mm. (2)

57° at 9 mm. (1)

[For prepn. of  $\bar{\text{C}}$  from propionyl chloride (3:7170) with ethylene +  $\text{AlCl}_3$  with or without diluent (50% yield (4)) (2), or over suitable cat. at 100-300° and at 20-200 atm. press. (3), see indic. refs.; from β-chloropropionyl chloride (3:5690) with  $\text{ZnEt}_2$  in toluene (70% yield) see (1).]

$\bar{\text{C}}$  with hot aq. alk. or alk. carbonates gives only resins, but  $\bar{\text{C}}$  on boilg. with dry diethylamine loses  $\text{HCl}$  yielding (1) ethyl vinyl ketone [Beil. I-731, I<sub>2</sub>-(791)], h.p. 96°.

$\bar{\text{C}}$  with diethyl sodio-malonate in ether gives (5) diethyl α-(γ-keto-n-amy)malonate, b.p. 166° at 14 mm. (5);  $\bar{\text{C}}$  with sodio-acetylacetone yields (5) the triketone 3-acetyloctanedione-2,6, h.p. 154° at 16 mm. (5);  $\bar{\text{C}}$  with ethyl sodio-acetoacetate in ether yields (6) the expected ethyl octandione-2,6-carboxylate-3 (3-carbethoxyoctanedione-2,6), h.p. 150° at 8 mm. (6).]

$\bar{\text{C}}$  with diethylamine in ether in cold, followed by treatment with dil. aq. alk., yields (7) 1-diethylaminopentanone-3, b.p. 84° at 13 mm.,  $n_D^{25} = 1.4368$  (7).]

$\bar{\text{C}}$  with aniline (2 moles) + a little water reacts vigorously on warming yielding (3) 1-anilinopentanone-3 [Beil. XII-214], tbs. from ether, m.p. 55.5° (8); note, however, that  $\bar{\text{C}}$  with aniline htd. in abs. alc. or  $\text{C}_6\text{H}_6$  (8), or  $\bar{\text{C}}$  with aniline htd. with conc.  $\text{HCl}$  (or 40%  $\text{H}_2\text{SO}_4$ ) + nitrobenzene (or  $\text{H}_3\text{AsO}_4$ ), gives (9) (4) 4-ethylquinoline [Beil. XX-406, XX-1(153)]].

$\bar{\text{C}}$  with hydrazine hydrate in  $\text{MeOH}$  gives (80% yield (10)) by ring closure 3-ethyl-Δ<sup>2</sup>-pyrazoline [Beil. XXIII-32], liq., b.p. 76° at 22 mm. (10) (corresp. picrate,  $\text{B.PkOH}$ , yel. ndls. from 95° alc., m.p. 117° (10)). —  $\bar{\text{C}}$  with phenylhydrazine in ether gives (10) by ring closure 3-ethyl-1-phenyl-Δ<sup>2</sup>-pyrazoline [Beil. XXIII-32], oil, h.p. 155° at 9 mm. (10).]

$\bar{\text{C}}$  with  $\text{NH}_2\text{OH.HCl}$  +  $\text{K}_2\text{CO}_3$  in aq.  $\text{MeOH}$  htd. for a few minutes gives (20% yield (10)) by ring closure 3-ethyl-Δ<sup>2</sup>-isoxazoline [Beil. XXVII-13], oil, b.p. 69° at 11 mm. (10).]

⊕ 1-Carbamido-3-ethyl-Δ<sup>2</sup>-pyrazoline: cryst. from  $\text{EtOAc}$  or  $\text{C}_6\text{H}_6$ , m.p. 96° (10).

[Note that  $\bar{\text{C}}$  with 1 equiv. semicarbazide  $\text{HCl}$  +  $\text{NaOAc}$  in aq. immediately ppts. the corresp. semicarbazone; this on htg. with strong aq.  $\text{NaOAc}$  (or  $\bar{\text{C}}$  + semicarbazide  $\text{HCl}$  + strong  $\text{NaOAc}$  soln. htd. directly) loses  $\text{HCl}$  and ring-closes to the indic. deriv. (10).]

VII-471, VII<sub>1</sub>-(254)] with  $SOCl_2$  or  $SO_2Cl_2$  by htg. at 100° in s.t. in absence of air (1), or from diphenyldiazomethane [Beil. VII-418, VII<sub>1</sub>-(226)] with liq. phosgene in pet. ether in s.t. (92% yield), see (6) ]

[For abnormal reactn. of  $\bar{C}$  with  $C_6H_5MgBr$  see (9) (10); for reactn. of  $\bar{C}$  with Zn filings in dry ether yielding diphenylketene (above) see (11), for reactn. of  $\bar{C}$  with phenylhydroxylamine in ether giving quant. yield of anhydro-[*N*-phenyl-benzilhydroxamic acid] [Beil. XXVII<sub>1</sub>-(290)], cryst. from MeOH, m.p. 72-73°, see (12).]

$\bar{C}$  in ether treated with gaseous  $NH_3$  (2) (13) yields  $\alpha$ -chloro-diphenylacetamide, m.p. 115° (2), 111-113° (13). [This product on boilg. with aq. yields (2) benzilamide, m.p. 154° (2) ]

$\bar{C}$  dissolvd. in dry ether and treated with 2 moles aniline in dry ether ppts aniline hydrochloride and from the filtrate addn. of pet. ether ppts (3)  $\alpha$ -chloro-diphenyl-acet-anilide, m.p. 85° (3); this prod. on htg. with more aniline or  $\bar{C}$  warmed with 4 moles aniline yields (3)  $\alpha$ -anilido-diphenyl-acet-anilide, ndls. from alc., m.p. 181-182° (3) [Both the first prod. (on treatment with  $Na_2CO_3$ ) and the latter prod. (on HCl hydrolysis) yield (3) benzoic acid anilide, m.p. 175° (3).]

## CHAPTER XXI

### DIVISION C. LIQUIDS WITH BOILING POINTS REPORTED ONLY UNDER REDUCED PRESSURE

3:9300-3:9599 ( $C_6-C_8$  inclusive)

(Arranged in sequence of empirical formulas)

— 1,2,4,4,6,6-HEXACHLOROCYCLOHEXEN-  
1-DIONE-3,5  
("Hexachlororesorcinol")

$C_6O_2Cl_6$  Beil. VII - 272  
VII<sub>1</sub>—

B.P. 159-160° at 13-15 mm.

M.P. 115°

See 3:3470. Division A: Solids.

3:9300 3,4-DICHLOROHEXATETRAENE-1,2,4,5  $C_6H_4Cl_2$  Beil. S.N. 14

B.P. 38-40° at 8 mm. (1)

$D_4^{20} = 1.1819$  (1)  $n_D^{20} = 1.5456$  (1)

[For prepn. of  $\bar{C}$  from 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306) with 15% excess KOH in abs. MeOH at 10-15° (a much larger amt. of 1,3,4-trichlorohexatriene-2,4,5 (3:9302) is also formed) see (1).]

3:9300 (1) Coffman, Carothers, *J. Am. Chem. Soc.* 55, 2040-2047 (1933).

3:9302 3,4,6-TRICHLOROHEXATRIENE-1,2,4  $C_6H_3Cl_3$  Beil. S.N. 13

B.P. 50° at 1 mm. (1)

$D_4^{20} = 1.3132$  (1)  $n_D^{20} = 1.5517$  (1)

[For prepn. of  $\bar{C}$  from 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306) with 15% excess KOH in abs. MeOH at 10-15° (a small amt. of 3,4-dichlorohexatetraene-1,2,4,5 (3:9300) is also formed) see (1).]

3:9302 (1) Coffman, Carothers, *J. Am. Chem. Soc.* 55, 2040-2047 (1933).

3:9304 3,6-DICHLOROHEXATRIENE-1,3,4  $C_6H_4Cl_2$  Beil. S.N. 13

B.P. 45-46° at 3 mm. (1)

$D_4^{20} = 1.1807$  (1)  $n_D^{20} = 1.5195$  (1)

38° at 1 mm. (1)

—— 5-Chloro-*n*-amyl acetate: b.p. 103° at 18 mm.,  $D_4^{20} \approx 1.0648$ ,  $n_D^{20} = 1.43791$  (1).

① 5-Chloro-*n*-amyl *N*-phenylcarbamate: m.p. 72° (1).

3:9295 (1) Bennett, Heathcoat, *J. Chem. Soc.* 1929, 273-274. (2) Anderson, Pollard, *J. Am. Chem. Soc.* 61, 3439-3440 (1939). (3) Bennett, Heathcoat, Mosses, *J. Chem. Soc.* 1929, 2569-2571. (4) Bennett, Turner, *J. Chem. Soc.* 1933, 814-815. (5) Magidson, Strukow, *Arch. Pharm.* 271, 575 (1933). (6) von Braun, *Ber.* 49, 974 (1916). (7) Ciemo, Hook, *J. Chem. Soc.* 1936, 608-609. (8) Anderson, Pollard, *J. Am. Chem. Soc.* 61, 3440-3441 (1939).

[For prepn. of  $\bar{C}$  from 3,6-dichlorohexatriene-1,3,4 (3:9304) with conc. HCl contg.  $Cu_2Cl_2$  by shaking for 12 hrs. at 27° see (1).]

$\bar{C}$  refluxed with stirring for 7 hrs. with aq.  $Na_2CO_3$  gives (1) chloride ion corresp. to three halogen atoms but the org. product was not identified.

$\bar{C}$  on oxidn. with alk.  $KMnO_4$  for 4 hrs. at 30–40° yields (1) chloroacetic acid (3:1370).

3:9308 (1) Coffman, Carothers, *J. Am. Chem. Soc.* 55, 2040–2047 (1933).

3:9310 1,3-DICHLOROHEXADIENE-2,4  
(Divinylacetylene dihydrochloride)

$C_6H_8Cl_2$

Beil. S.N. 12

B.P. 80–82° at 17 mm. (1)

$D_4^{20} = 1.1456$  (1)  $n_D^{20} = 1.5271$  (1)

[For prepn. of  $\bar{C}$  (53% yield (1)) from divinylacetylene by shaking with 12 N HCl contg.  $Cu_2Cl_2$  see (1).]

$\bar{C}$  refluxed with NaOAc + AcOH yields (by reactn. of one chlorine atom) 1-acetoxy-3-chlorohexadiene-2,4, b.p. 84–85° at 3 mm.,  $D_4^{20} = 1.0915$ ,  $n_D^{20} = 1.4890$  (1). — Similarly  $\bar{C}$  on htg. with MeOH/KOH yields (1) 1-methoxy-3-chlorohexadiene-2,4, n.p. 88–92° at 30 mm.,  $D_4^{20} = 1.0239$ ,  $n_D^{20} = 1.4928$  (1).

$\bar{C}$  on oxidn. with aq.  $KMnO_4$  in  $K_2CO_3$  soln. gives (1) chloroacetic acid (3:1370) + acetic acid (1:1010).

$\bar{C}$  with naphthoquinone-1,4 (1:9040) or with maleic anhydride (1:0625) gives (1) only a small amt. of dark gummy material.

3:9310 (1) Coffman, Nieuwland, Carothers, *J. Am. Chem. Soc.* 55, 2048–2051 (1933).

3:9312 3-CHLOROHEXADIENE-1,3

Cl

$C_6H_7Cl$

Beil. S.N. 12

B.P. 68.2–69° at 117 mm. (1)

$D_4^{20} = 0.9390$  (1)  $n_D^{20} = 1.4770$  (1)

[For prepn. of  $\bar{C}$  from  $\alpha$ -ethyl- $\beta$ -vinylacetylene by shaking with conc. HCl contg.  $Cu_2Cl_2$  +  $NH_4Cl$  see (1).]

[For polymerization of  $\bar{C}$  see (1) (2).]

$\bar{C}$  on htg. with 2 pts. naphthoquinone-1,4 (1:9040) for 2 hrs. at 100° then suspended in alc. NaOH and aerated gives (1) 2-chloro-1-ethylanthraquinone, yel. ndls. from alc., m.p. 151–152° (1).

[For study of another chlorohexadiene obtd. from allyl chloride (3:7035) by actn. of  $NaNH_2$  in liq.  $NH_3$  see (3) ]

3:9312 (1) Jacobson, Carothers, *J. Am. Chem. Soc.* 55, 1624–1627 (1933). (2) Carothers, Coffman (to du Pont), U.S. 1,950,441, March 13, 1934; *Cent.* 1934, II 1037; *C.A.* 28, 3270 (1934). (3) Kharasch, Nudenberg, Sternfeld, *J. Am. Chem. Soc.* 62, 2034–2035 (1940).

3:9314 1-CHLORO-3-METHYLPENTADIENE-1,2

$C_6H_9Cl$

Beil. S.N. 12

B.P. 68–70° at 100 mm. (1)

$D_4^{20} = 0.9562$  (1)  $n_D^{20} = 1.46967$  (1)

[For formn. of  $\bar{C}$  from 3-methylpentyn-1-ol-3 (ethyl-ethynyl-methyl-carbinol) by shaking

[For prepn. of  $\bar{C}$  from hexadien-2,5-yne-3 (divinylacetylene) (2) with  $Cl_2$  in  $CCl_4$  at  $-50^\circ$  (20-25% yield together with other products) or in small yield with  $HOCl$  see (1).]

$\bar{C}$  slowly polymerizes, changing in 3 months to a viscous sirup (1).

$\bar{C}$  on cat. hydrogenation in  $EtOAc$  yields *n*-hexane (1:8530), b.p.  $69-70^\circ$  (1).

$\bar{C}$  on cat. hydrogenation in  $CCl_4$  at  $0^\circ$  gives (1) 1,3,4,6-tetrachlorohexadiene-2,4  
 $n_D^{20} = 1.5458$  (1).

12 hrs. at  $27^\circ$  adds  $HCl$  yielding (1) 3,3,6-trichlorohexadiene-1,4 (3:9308) q.v.

$\bar{C}$  refluxed with stirring for 8 hrs. with 6 pts. aq. contg. 2 moles  $Na_2CO_3$  gives (1) chloride ion corresp. to one of the two initial halogenations together with a soft sticky resin. —  $\bar{C}$  with  $MeOH/KOH$  at  $10-15^\circ$  or with  $NaOMe$  in dry  $MeOH$  loses 1  $HCl$  giving excellent yield (1) of 3-chlorohexatetraene-1,3,4,5 (3:7735).

$\bar{C}$  on oxidn. with aq.  $KMnO_4$  yields (1) chloroacetic acid (3:1370).

3:9304 (1) Coffman, Carothers, *J. Am. Chem. Soc.* 55, 2040-2047 (1933). (2) Nieuwland, Calcott, Downing, Carter, *J. Am. Chem. Soc.* 53, 4200-4202 (1931).

3:9306 1,3,4,6-TETRACHLOROHEXADIENE-2,4  $C_6H_2Cl_4$  Beil. S.N. 12

B.P.  $84-89^\circ$  at 2 mm. (1)

$D_4^{20} = 1.4013$  (1)  $n_D^{20} = 1.5465$  (1)

[For prepn. of  $\bar{C}$  from hexadien-2,5-yne-3 (divinylacetylene) (2) with  $Cl_2$  at  $-40^\circ$  to  $-50^\circ$  (together with other products) see (1).]

$\bar{C}$  treated directly with  $Cl_2$  for 8 hrs. at  $60-70^\circ$  gives (23% yield (1)) 1,2,3,4,5,6-hexachlorohexene-3 (3:1220), m.p.  $57-58^\circ$  (1)

$\bar{C}$  refluxed for 8 hrs. with stirring with aq.  $Na_2CO_3$  soln. gives (1) chloride ion corresp. to two of the initial four chlorine atoms. —  $\bar{C}$  with abs.  $MeOH/KOH$  at  $10-15^\circ$  loses  $HCl$  in each of two ways yielding (1) both 1,3,4-trichlorohexatriene-2,4,5 (3:9302) and 3,4-dichlorohexatetraene-1,2,4,5 (3:9300).

$\bar{C}$  on oxidn. with aq.  $KMnO_4$  for 5 hrs. at  $35-40^\circ$  gives (1) chloroacetic acid (3:1370).

3:9306 (1) Coffman, Carothers, *J. Am. Chem. Soc.* 55, 2040-2047 (1933). (2) Nieuwland, Calcott, Downing, Carter, *J. Am. Chem. Soc.* 53, 4200-4202 (1931)

1,2,3,4,5,6-HEXACHLOROHEXENE-3

$C_6H_2Cl_6$

Beil. S.N. 11

B.P.  $110-112^\circ$  at 2 mm.

M.P.  $58-59^\circ$

See 3:1220. Division A: Solids.

3:0308 3,3,6-TRICHLOROHEXADIENE-1,4

$C_6H_3Cl_3$

Beil. S.N. 12

B.P.  $100-103^\circ$  at 4 mm. (1)

$D_4^{20} = 1.3030$  (1)  $n_D^{20} = 1.5585$  (1)

B.P. 55° at 130 mm. (1)  $D_4^{20} = 0.9163$  (1)  $n_D^{20} = 1.4330$  (1) (2)  
 51-52° at 135 mm. (2) 0.9140 (2)  
 48-50° at 100 mm. (3) 0.9141 (3)  $n_D^{20} = 1.42963$  (3)

[For prepn. of  $\bar{\text{C}}$  from 3-methylpentyn-1-ol-3 (ethyl-ethynyl-methyl-carbinol) by shaking with conc. HCl (40% yield (2)) best overnight (60% yield (1)); if the acid also contains  $\text{Cu}_2\text{Cl}_2 + \text{NH}_4\text{Cl}$ ,  $\bar{\text{C}}$  is accompanied (3) by 1-chloro-3-methylpentadiene-1,2 (3:9314).] [Note that dry HCl at 0° reacts with the alc. only slightly while  $\text{PCl}_3$  + pyridine gave a product difficult to purify (1).]

$\bar{\text{C}}$  with  $\text{CH}_3\text{MgBr}$  gives (66% yield (1)) 3,3-dimethylpentyne-1, b.p. 69° at 100 mm,  $D_4^{20} = 0.7610$ ,  $n_D^{20} = 1.4360$ ;  $\bar{\text{C}}$  with  $\text{C}_2\text{H}_5\text{MgBr}$  gives (61% yield (1)) 3-ethyl-3-methylpentyne-1, b.p. 88° at 100 mm,  $D_4^{20} = 0.7714$ ,  $n_D^{20} = 1.4386$ . [In orig. paper these products are incorrectly numbered and named.]

*Chem. Soc.* 62, 1793-1800 (1940). (2) K. N. Campbell, B. K. 0, 2882-2884 (1938). (3) Favorskaya, Zakharova, *J. Gen. C.A.* 34, 7844 (1940).

B.P. 57-61° at 47 mm. (1)  $n_D^{20} = 1.4143$  (1)

[For prepn. of  $\bar{\text{C}}$  (33% yield (1)) from 2-methylpropyn-3-ol-2 (trimethylpropargyl alcohol) with  $\text{PCl}_3$  in dry ether see (1).]

$\bar{\text{C}}$  in acetone refluxed 4 hrs. with  $\text{K}_2\text{CO}_3$  and phenol gives (69% yield (1)) phenyl trimethylpropargyl ether,  $n_D^{20} = 1.3408$ , but undistillable without decomposition (1).

3:9324 (1) Hurd, Cohen, *J. Am. Chem. Soc.* 53, 1074 (1931).

B.P. 90-93° at 10 mm. (1) (2)  $D_4^{25} = 1.225$  (1) (2)  $n_D^{25} = 1.4760$  (1) (2)

This compound was at first (2) thought to be 1,2,2-trichlorohexane but later (1) was established as  $\bar{\text{C}}$ .

[For formn. of  $\bar{\text{C}}$  from hexyne-1 (*n*-butylacetylene) (1:8055) with  $\text{Cl}_2$  in aq. *ter*-BuOH, MeOAc, AcOH, or  $\text{Ac}_2\text{O}$  at 45° (2) or in 35% aq. HCl, 30% aq.  $\text{H}_2\text{SO}_4$ , 30%  $\text{H}_3\text{PO}_4$ , or 22% MeOH/HCl (1) see indic. refs.]

3:9326 (1) Norris, Hennion, *J. Am. Chem. Soc.* 62, 449-450 (1940). (2) Norris, Vogt, Hennion, *J. Am. Chem. Soc.* 61, 1460-1461 (1939).

with conc. HCl contg.  $\text{Cu}_2\text{Cl}_2 + \text{NH}_4\text{Cl}$  see (1) (considerable 3-chloro-3-methylpentyne-1 (3:9322) is also formed.)

$\bar{\text{C}}$  on stdg. 8 months with  $\text{Cu}_2\text{Cl}_2$ ,  $\text{NH}_4\text{Cl}$ , plus a few drops conc. HCl isomerized to 1-chloro-3-methylbutadiene-1,3 (3:7355) (1).

3:9314 (1) Favorskaya, Zakharova, *J. Gen. Chem. (U.S.S.R.)* 10, 446-450 (1940); *C.A.* 34, 7844 (1940).

3:9316 1-CHLORO-3-METHYLPENTADIENE-1,3  $\text{C}_6\text{H}_9\text{Cl}$  Beil. S.N. 12

B.P. 62-63° at 100 mm. (1)  $D_4^{20} = 0.9574$  (1)  $n_D^{20} = 1.47714$  (1)

[For prepn. of  $\bar{\text{C}}$  from 1-chloro-3-methylpentadiene-1,2 (3:9314) by stdg 8 months with  $\text{Cu}_2\text{Cl}_2$ ,  $\text{NH}_4\text{Cl}$ , plus a few drops conc. HCl see (1) ]

$\bar{\text{C}}$  reacts with maleic anhydride (1-0625) to give a mixt. from which after hydrolysis two acids, one m.p. 218-220°, the other, m.p. 350-351°, are obtd. (1).

3:9316 (1) Favorskaya, Zakharova, *J. Gen. Chem. (U.S.S.R.)*, 10, 446-450 (1940); *C.A.* 34, 7844 (1940).

3:9318 2-CHLORO-3-METHYLPENTADIENE-1,3  $\text{C}_6\text{H}_9\text{Cl}$  Beil. S.N. 12

B.P. 57-60° at 96 mm. (1)  $D_4^{20} = 0.9437$  (1)  $n_D^{20} = 1.4671$  (1)

[For prepn. of  $\bar{\text{C}}$  from 3-methylpenten-2-yne-4 in 22% yield (1) by shaking for 5½ hrs at 20° with conc. HCl contg.  $\text{Cu}_2\text{Cl}_2 + \text{NH}_4\text{Cl}$  see (1).]

$\bar{\text{C}}$  on htg with 2 pts. naphthoquinone-1,4 (1.9040) for 1 hr. at 100° gives (1) on cooling 2-chloro-3,4-dimethyltetrahydroanthraquinone, colorless ndls from aq. acetone, m.p. 107° (1); suspension of this intermediate in dil. alc. NaOH and aeration until the purple solution becomes yellow gives (1) 2-chloro-3,4-dimethylanthraquinone, yel. cryst. from AcOH, m.p. 171.5° (1).

[For polymerization of  $\bar{\text{C}}$  see (1) (2) ]

3:9318 (1) Carothers, Coffman, *J. Am. Chem. Soc.* 54, 4075-4076 (1932). (2) Carothers, Coffman (to du Pont), U.S. 1,950,441, March 13, 1934; *Cent.* 1934, II 1038, *C.A.* 28, 3270 (1934).

3:9320 1-CHLOROHEXYNE-1  $\text{C}_6\text{H}_9\text{Cl}$  Beil. S.N. 12

B.P. 47° at 55 mm. (1)  $n_D^{25} = 1.43350$  (1)

[For prepn. of  $\bar{\text{C}}$  from hexyne-1 (1:8055) by conversion in liq.  $\text{NH}_3$  to  $\text{C}_4\text{H}_9\text{C}\equiv\text{C}-\text{K}$  and treatment of this prod. in ether suspension with  $\text{Cl}_2$  at -32° see (2) (3); for prepn. of  $\bar{\text{C}}$  from  $\text{C}_4\text{H}_9\text{C}\equiv\text{C}.\text{Na}$  with benzenesulfonyl chloride in ether see (1) (4).]

$\bar{\text{C}}$  in MeOH + HgO +  $\text{BF}_3$  as specified (2) adds 2 MeOH giving in 83% yield 1-chloro-2,2-dimethoxyhexane, b.p. 77-80° at 14 mm,  $D_4^{25} = 0.9873$ ,  $n_D^{25} = 1.4305$  (2).

3:9334 *d,l*-3-CHLOROHEXENE-1 $\text{C}_6\text{H}_{11}\text{Cl}$ 

Beil. S.N. 11

[This compound is as yet unrecorded: a dextrorotatory isomeride has been prepared (1) from levorotatory hexen-1-ol-3 with  $\text{PCl}_3$  in pyridine. Although distd. at 20 mm., no b.p. was reported (1).]

3:9334 (1) Levene, Haller, *J. Biol. Chem.* **83**, 595 (1929).

3:9336 *cis*-1-CHLOROHEXENE-3 $\text{C}_6\text{H}_{11}\text{Cl}$ 

Beil. S.N. 11

B.P. 59-61° at 60 mm. (1)

 $D_4^{24} = 0.900$  (1)  $n_D^{24} = 1.435$  (1)

Two geometrical stereoisomers of this structure are theoretically possible, but only that with the *cis* configuration ( $\bar{C}$ ) has as yet been recognized.

[For prepn. of  $\bar{C}$  from *cis*-hexen-3-ol-1 [Beil. I<sub>1</sub>-(229), I<sub>2</sub>-(486)] (1) (2) (b.p. 156.1° at 760 mm. (3), 63.3° at 14 mm. (3),  $D_4^{21.6} = 0.8478$  (2),  $n_D^{24} = 1.4373$  (2), 3,5-dinitrobenzoate, m.p. 44.5-46°, *N*-( $\alpha$ -naphthyl)carbamate, m.p. 80° (4)) with  $\text{SOCl}_2$  + pyridine in  $\text{CHCl}_3$  (72% yield (1)) see (1).]

$\bar{C}$  with NaI htd. 12 hrs. in acetone yields (1) 1-iodohexene-3, b.p. 62-63° at 12 mm.,  $D_4^{21} = 1.469$  (1).

$\bar{C}$  fails to react with activated Mg in dry ether, but the corresponding iodo cpd. (see above) yields the corresp. RMgI (1), and a mixt. of both can be used (5).

Beil. S.N. 466

This compound appears to be unreported. However, for many isomeric compounds see the Formula Index.

3:9402 5-CHLORO-5-METHYLHEXEN-1-YNE-3  $C_7H_9Cl$  Beil. S.N. 13  
 (2-Chloro-2-methylhexen-5-yne-3;  
 dimethyl-vinylethynyl-carbinyl  
 chloride)  $CH_2=CH-C\equiv C-\overset{\overset{Cl}{|}}{\underset{\underset{CH_3}{|}}{C}}-CH_3$

B.P. 48-49° at 28 mm. (1)

$n_D^{15} = 1.4812$  (1)

31-32° at 10 mm. (1)

[For prepn. of  $\bar{C}$  from dimethyl-vinylethynyl-carbinol (b.p. 58-59° at 13 mm,  $D_4^{15} = 0.8925$ ,  $n_D^{15} = 1.4786$  (2), see (1).]

[ $\bar{C}$  with phenol + KOH in acetone refluxed 3 hrs. yields (3) about equal amts. of 2-methylhexadien-1,5-yne-3 ( $\alpha$ -isopropenyl- $\beta$ -vinyl-acetylene) + the phenyl ether of  $\bar{C}$  (dimethyl-phenoxy-vinylethynyl-methane), b.p. 105.5° at 7 mm.,  $D_4^{16} = 0.9714$ ,  $n_D^{15} = 1.5350$  (3).]

3:9402 (1) Nazarov, *Bull. acad. sci. U.R.S.S., Classe sci. math. nat., Ser. chim.* 1938, 695-705; *Cent.* 1939, II 3403; *C.A.* 33, 5682 (1939). (2) Nazarov, *Bull. acad. sci. U.R.S.S., Classe sci. math. nat., Ser. chim.* 1938, 683-694; *Cent.* 1939, II 3402; *C.A.* 33, 5682 (1939). (3) Nazarov, Elizarova, *Bull. acad. sci. U.R.S.S., Classe sci. chim.* 1941, 423-430; *C.A.* 36, 1298 (1942).

3:9406 1-CHLORO-3-ETHYLPENTADIENE-1,2  $C_7H_{11}Cl$  Beil. S.N. 12  
 $CH_3CH_2-\overset{\overset{Cl}{|}}{C}=\overset{\underset{\underset{C_2H_5}{|}}{C}}{C}=CH$

B.P. 85-88° at 100 mm. (1)

$D_4^{18.5} = 0.9297$  (1)  $n_D^{18.5} = 1.47036$  (1)

$D_4^{16.5} = 0.9329$  (1)  $n_D^{16.5} = 1.48431$  (1)

[For prepn. of  $\bar{C}$  from 3-ethylpentyn-1-ol-3 (diethyl-ethynyl-carbinol) [Beil. I<sub>1</sub>-(236), I<sub>2</sub>-(506)] (1) directly, or from the intermediate 1-chloro-3-ethylpentyn-1 (3:9410) by rearr., on shaking either with aq. HCl contg.  $Cu_2Cl_2$  +  $NH_4Cl$  (some 3-ethylpenten-3-yne-1 also being formed in the latter case) see (1).]

$\bar{C}$  with nq. +  $CaCO_3$  first isomerizes to 1-chloro-3-ethylpentyn-1 (3:9410) which then yields 3-ethylpentyn-1-ol-3 (b.p. 136-137°,  $D_4^{17} = 0.8748$ ; *N*-phenylcarbamate, m.p. 52-53° (1); allophanate, m.p. 130-131° (2)) and 3-ethylpenten-3-yne-1, b.p. 41-43° at 100 mm,  $D_4^{13} = 0.7733$ ,  $n_D^{13} = 1.43962$ ,  $n_D^{15} = 1.45224$  (1).

3:9406 (1) T. A. Favorskaya, I. A. Favorskaya, *J. Gen. Chem. (U.S.S.R.)* 10, 451-460 (1940); *C.A.* 34, 7844 (1940). (2) Locquin, Sung, *Bull. soc. chim.* (4) 33, 601 (1924).

3:9410 1-CHLORO-3-ETHYLPENTYNE-1  $C_7H_{11}Cl$  Beil. S.N. 12  
 $CH_3CH_2-\overset{\underset{\underset{C_2H_5}{|}}{CH}}{C}-\overset{\overset{Cl}{|}}{C}\equiv C$

B.P. 73-76° at 100 mm. (1)

$D_4^{18.5} = 0.0230$  (1)  $n_D^{18.5} = 1.44372$  (1)

$D_4^{16.5} = 0.9330$  (1)  $n_D^{16.5} = 1.45364$  (1)

[For prepn. of  $\bar{C}$  from 3-ethylpentyn-1-ol-3 (diethyl-ethynyl-carbinol) [Beil. I<sub>1</sub>-(236), I<sub>2</sub>-(506)] (1) on shaking with HCl alone, or with HCl +  $Cu_2Cl_2$  +  $NH_4Cl$  (70% yield together in the latter case with a maximum of 25-30% 1-chloro-3-ethylpentadiene-1,2 (3:9406)) see (1).]

$\bar{C}$  on shaking with  $HCl + Cu_2Cl_2 + NH_4Cl$  is partly converted to 1-chloro-3-ethylpentadiene-1,2 (3:9406) (some 3-ethylpenten-3-yne-1 also being formed), but without the  $HCl$  no action occurs (1).

$\bar{C}$  easily loses  $HCl$  yielding 3-ethylpenten-3-yne-1, b.p.  $41-43^\circ$  at 100 mm.,  $D_4^{13} = 0.7733$ ,  $n_D^{13} = 1.43962$ ,  $n_D^{14} = 1.45224$  (1).

$\bar{C}$  upon hydrolysis (1) with aq.  $+ CaCO_3$  gives a mixt. of 3-ethylpentyn-1-ol-3 (b.p.  $136-137^\circ$ ,  $D_4^{17} = 0.8748$ ,  $n_D^{14} = 1.4385$ ,  $n_D^{14} = 1.44697$  (1) [N-phenylcarbamate, m.p.  $52-53^\circ$  (1), allophanate, m.p.  $130-131^\circ$  (2)]) and 3-ethylpenten-3-yne-1 (see above).

3:9410 (1) T. A. Favorskaya, I. A. Favorskaya, *J. Gen. Chem. (U.S.S.R.)* 10, 451-460 (1940); *C.A.* 34, 7844 (1940). (2) Locquun, Sung, *Bull. soc. chim.* (4) 35, 601 (1924).

### 3:9412 *d,l*-3-CHLOROHEPTENE-1

 $C_7H_{13}Cl$ 

Beil. S.N. 11

(n-Butyl-vinyl-carbinyl chloride)

$\bar{C}$  as such is as yet unreported, but both of the opt. active stereoisomerides have been prepared.

[The dextrorotatory isomer, b.p.  $92-94^\circ$  at 125 mm. (1),  $87-88^\circ$  at 90 mm. (1),  $D_4^{25} = 0.8857$  (1), has been obtd. from levorotatory hepten-1-ol-3 (n-butyl-vinyl-carbinol) [Beil. I<sub>2</sub>(488)] with  $PCl_5$  in dry ether (1), with  $PCl_5 +$  pyridine (2), or from levorotatory 3-bromoheptene-1 (1) with  $LiCl$  in  $MeOH$  (1).

[Upon ozonolysis in  $CHCl_3$  followed by  $Br_2/aq.$  oxidn. of the resultant aldehyde, levorotatory  $\alpha$ -chlorocaproic acid, b.p.  $80-95^\circ$  at 1 mm., was obtd. (2).]

[The levorotatory isomer, b.p.  $87-90^\circ$  at 92 mm. (3),  $D_4^{25} = 0.8883$  (4),  $n_D^{25} = 1.4380$  (4), has been obtd. from dextrorotatory hepten-1-ol-3 (n-butyl-vinyl-carbinol) [Beil. I<sub>2</sub>(488)] with  $PCl_5$  (3); upon catalytic hydrogenation it yields (3) dextrorotatory 3-chloroheptane, b.p.  $87-90^\circ$  at 113 mm.,  $n_D^{25} = 1.4221$  (3); cf. *d,l*-isomer (3:8080).]

### 3:9414 4-CHLORO-3-METHYLHEXENE-2

 $C_7H_{13}Cl$ 

Beil. I—

I<sub>1</sub>-(91)I<sub>2</sub>—B.P.  $51^\circ$  at 11.5 mm. (1)

[For prepn. of  $\bar{C}$  from 3-methylhexen-2-ol-4 [Beil. I-447, I<sub>1</sub>-(229)] with 6 N  $HCl$  see (1).]

3:9414 (1) Abellmann, *Ber.* 43, 1581 (1910).

### 3:9418 4-CHLORO-2,4-DIMETHYLPENTENE-2

 $C_7H_{13}Cl$ 

Beil. S.N. 11

(2-Chloro-2,4-dimethylpentene-3; trimethylcrotyl chloride)

[ $\bar{C}$  is too unstable for purification by distillation; however, it can be prepared in solution from 2,4-dimethylpenten-3-ol-2 (1) with  $PCl_5$  in dry ether.]

benzene (3:1400) with  $\text{Cl}_2$  in pres. of  $\text{Al/Hg}$  see (11); from benzene (12), chlorobenzene (13), or diphenyl sulfone (14) with  $\text{Cl}_2$  followed by treatment with alc.  $\text{KOH}$  see indic. refs.] [For behavior of  $\bar{\text{C}}$  with liq.  $\text{Cl}_2$  yielding addn. products see (15).]

[For behavior of  $\bar{\text{C}}$  with  $\text{NaOMe}$  see (2) (16).]

$\bar{\text{C}}$  on mononitration, e.g., by boilg. for  $\frac{1}{2}$  hr. with 3 pts.  $\text{HNO}_3$  ( $D = 1.52$ ) as directed (17), gives 96.7% yield (17) 1,2,3,5-tetrachloro-4-nitrobenzene, cryst. from spontaneous evapn. of alc. soln., m.p. 40–41° (17) (the m.p. of 21–22° previously reported (5) was on impure material).

$\bar{\text{C}}$  on dinitration, e.g., by boilg. with a mixt. of 10 pts. fuming  $\text{HNO}_3$  ( $D = 1.52$ ) + 4 pts. conc.  $\text{H}_2\text{SO}_4$  for 1 hr. and then pouring into aq. (17), gives (100% yield (17)) (9) 1,2,3,5-tetrachloro-4,6-dinitrobenzene [Beil. V-266], pl. from 90%  $\text{AcOH}$ , m.p. 162° (9), 161–162° (17). (This prod. on htg. with aniline yields (9) (18) 2-chloro-1,3,5-trianilino-4,6-dinitrobenzene, crimson pl., m.p. 179° (9), 179–180° (18).)

### 3:0925 $\alpha,\beta,\beta$ -TRICHLORO-*n*-BUTYRIC ACID

M.P. 51.5–52° (1)

This from lgr. — Spar. sol. aq., eas. sol. alc., ether,  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ ,  $\text{CS}_2$ .

[For prepn. of  $\bar{\text{C}}$  from either  $\beta$ -chlorocrotonic acid (3:2625) or  $\beta$ -chloroisocrotonic acid (3:1300) in  $\text{CS}_2$  soln. with  $\text{Cl}_2$  stood several days in the dark see (1).]

[ $\bar{\text{C}}$  in aq. with granulated  $\text{Zn}$  stood for 6 weeks, then acidified, yields (1) mainly  $\beta$ -chloroisocrotonic acid (3:1300) accompanied by some  $\beta$ -chlorocrotonic acid (3:2625); note that former is separated from latter by its greater volatility with steam.]

$\bar{\text{C}}$  with aq.  $\text{Na}_2\text{CO}_3$  soln. on boilg. loses both  $\text{HCl}$  and  $\text{CO}_2$  yielding the higher-boilg. (1) 1,2-dichloropropene-1 (3:5150).

$\bar{\text{C}}$  with alc.  $\text{KOH}$  (2 moles) loses  $\text{HCl}$  yielding (1) mainly  $\alpha,\beta$ -dichloroisocrotonic acid [Beil. II-418], m.p. 75.5°, accompanied by a little  $\alpha,\beta$ -dichlorocrotonic acid [Beil. II-418], m.p. 92°; note that these are separated by the greater soly. of the former in lgr. (1).

The acid chloride corresp. to  $\bar{\text{C}}$  is unreported.

— Methyl  $\alpha,\beta,\beta$ -trichloro-*n*-butyrate: unreported.

— Ethyl  $\alpha,\beta,\beta$ -trichloro-*n*-butyrate: unreported.

—  $\alpha,\beta,\beta$ -Trichloro-*n*-butyramide: unreported.

—  $\alpha,\beta,\beta$ -Trichloro-*n*-butyranilide: unreported.

—  $\alpha,\beta,\beta$ -Trichloro-*n*-butyr- $\alpha$ -naphthalide: unreported.

[For prepn. of  $\bar{C}$  from heptanone-4 (butyrene) (1:5447) with  $\text{PCl}_5$  see (1); note that heptyne-3 (1:8095), b.p. 105–106°, and 4-chloroheptene-3 (3:8023) are also formed (1). The earlier prepn. are regarded as impure.]

3:9558 2-CHLORO-3,4-DIMETHYLHEXANE  $C_8H_{17}Cl$  Beil. S.N. 10

No physical constants on this compound are recorded; for its formation, however, as a by-product of the addition of HCl to butene-2 see (1)

3:9558 (1) Coffin, Sutherland, Maass, *Can. J. Research* 2, 275-276 (1930).

3:9560 4-(CHLOROMETHYL)-3-METHYLHEXANE  $C_8H_{17}Cl$  Beil. S.N. 10

150° (42) (40), 149° (41);  $\bar{C}$  with acenaphthene gives (65–68% yield (43)) 5-(phenylacetyl)-acenaphthene (4-acenaphthyl benzyl ketone), m.p. 114° (43);  $\bar{C}$  with bromobenzene (in  $CS_2$ ) gives (44) 4-bromodesoxybenzoin, m.p. 114–115°, b.p. 165° at 3 mm. (44).] — [For oxidn. of many of these with  $SeO_2$  to corresp. benzils see (38).]

[ $\bar{C}$  with phenols +  $AlCl_3$  (often in nitrobenzene) similarly yields hydroxy-substituted desoxybenzoins: e.g.,  $\bar{C}$  with phenol as directed gives (60–70% yield (45)) 4-hydroxy-desoxybenzoin [Beil. VIII-165], m.p. 142° cor. (45);  $\bar{C}$  with *o*-cresol gives (60–70% yield (46)) 4-hydroxy-3-methyldesoxybenzoin [Beil. VIII-183], m.p. 152° (46);  $\bar{C}$  with salicylic acid (1:0780) gives (47) 4-hydroxy-3-carboxy-desoxybenzoin; for similar reactn. with catechol resorcinol, and hydroquinone (48) or with phloroglucinol (49) see indic. refs.]

[ $\bar{C}$  with phenol ethers +  $AlCl_3$  (often in nitrobenzene) similarly yields substituted desoxybenzoins: e.g.,  $\bar{C}$  with anisole (1:7445) +  $SnCl_4$  (61) or  $AlCl_3$  (34) (50) gives 4-methoxydesoxybenzoin [Beil. VIII-166, VIII-1-571], m.p. 77°;  $\bar{C}$  with methyl *m*-tolyl ether (1:7510) +  $SnCl_4$  (not  $AlCl_3$ ) gives (60–70% yield (51)) (50) 4-methoxy-2-methyldesoxybenzoin, m.p. 76.5° (51);  $\bar{C}$  with methyl *p*-tolyl ether (1:7495) +  $AlCl_3$  in  $CS_2$  gives (11) 2-methoxy-5-methyldesoxybenzoin, m.p. 75°, b.p. 205–207° at 14 mm. (11).]

$\bar{C}$  with phenols on htg. gives corresp. esters: e.g.,  $\bar{C}$  with phenol at 150° for 8 hrs. (6) (or  $\bar{C}$  with phenol + aq. alk. (52)) yields phenyl phenylacetate [Beil. IX-435], ndls. from lt. pet., m.p. 50° (6), 42° (52);  $\bar{C}$  with  $\beta$ -naphthol at 150° for 6 hrs. yields (6)  $\beta$ -naphthyl phenylacetate, pl. from lt. pet., m.p. 87° (6);  $\bar{C}$  with *o*-cresol at 90° yields (9) *o*-tolyl phenylacetate, m.p. 44–45° (9);  $\bar{C}$  with *m*-cresol at 90° yields (9) *m*-tolyl phenylacetate, m.p. 51–52° (9);  $\bar{C}$  with *p*-cresol at 90° yields (9) *p*-tolyl phenylacetate, m.p. 74–75° (9).

[ $\bar{C}$  with  $MeZnI$  (53) in toluene +  $EtOAc$  or with  $Me_2Zn$  (54) gives (72% yield (53)) benzyl methyl ketone (phenylacetone) (1:5118);  $\bar{C}$  with  $EtZnI$  (53) or with  $Et_2Zn$  (54) gives (78% yield (53)) benzyl ethyl ketone [Beil. VII-314, VII-1-(167)]]

[ $\bar{C}$  + *o*-hydroxyacetophenone (1:1746) +  $Na\bar{A}$  at 180° for 5 hrs. followed by hydrol. with alc. KOH gives (6) 4-methyl-3-phenylcoumarin, m.p. 163° (6);  $\bar{C}$  with 2-hydroxy-5-methylbenzophenone +  $Na\bar{A}$  at 180° gives (80–90% yield (55)) 3,4-diphenyl-6-methylcoumarin, cryst. from  $AcOH$ , m.p. 208–209° (55).]

[ $\bar{C}$  with diazomethane in ether gives acc. to cond. (56) (57) (58) (52) either (yield: 84% (55), 83% (62))  $\alpha$ -chloro- $\gamma$ -phenylacetone [Beil. VII-1-(162)], m.p. 72–73° (56), b.p. 133–135° at 19 mm. (62),  $n_D^{20} = 1.5379$  (62), or  $\alpha$ -diazo- $\gamma$ -phenylacetone (identified by reactn. with *p*-nitrobenzoic acid yielding (58)  $\alpha$ -(*p*-nitrobenzoyloxy)- $\alpha$ -phenylacetone, pl. from alc., m.p. 120° (58)); note, however, that work of (56) could not be duplicated by later investigators (68) (62).]

[ $\bar{C}$  with biuret yields (69) *N*-(phenylacetyl)biuret, cryst. from alc., m.p. 199–200° u.c. dec. (59).]

[ $\bar{C}$  with ethyl carbamate (urethane) at 60–70° gives (70% yield (60)) ethyl *N*-(phenylacetyl)carbamate, m.p. 113° (60).]

[ $\bar{C}$  with  $MeOH$  yields methyl phenylacetate (1:3771), b.p. 220°;  $\bar{C}$  with  $EtOH$  yields ethyl phenylacetate (1:3872), b.p. 227.5°.] [For use in prepn. of cellulose esters see (61).]

$\bar{C}$  on hydrolysis yields phenylacetic acid (1:0665), m.p. 76.6°; for the amide, anilide, *p*-toluidide, and other derivs. corresp. to  $\bar{C}$  see phenylacetic acid (1:0665)

(For prepn. of  $\bar{C}$  from phenylethylene (styrene) (1 7135) by addition of HOCl generated from  $Ca(OCl)_2$  +  $CO_2$  (76% yield (2)), from  $NaOCl$  +  $CO_2$  (6), from  $N$ -chlorosuccinimide +  $AcOH$  (yield: 70% (1), 52% (4)), or from *tert*-butyl hypochlorite (3 7165) in dil.  $AcOH$  (60-70% yield (1)) see indie. refs. (note that conversion of  $AcOH$  in *tert*-BuOCl method leads to 1 min. by direct addn. (4) of chloromethyl-phenylbenzyl *tert*-butyl ether, b.p. 87-88° at 1.5 mm.,  $D_4^{25} = 1.0519$ ,  $n_D^{25} = 1.5102$  (4))

(For prepn. of  $\bar{C}$  from chloromethylolide (1 7212) with  $C_6H_5MgBr$  in ether (71% yield (1)) or from  $\alpha$ , $\beta$ -dichlorophenylethane (styrene dichloride) (1 6682) with a mild dehydrochlorinating agent such as  $Na_2CO_3$ ,  $NaOAc$ ,  $CaO$ , or  $CaCO_3$  (not an alkali hydroxide) and methyl (2) see indie. refs.]

( $\bar{C}$  with a)  $KOH$  (1) or with an alk. or alk. earth metal oxide or hydroxide as directed (5) (6) or with  $HCl$  with neg. charge to phenylethylolane (styrene oxide) (Beil. XVII-49 of Cl, b.p. 191-192°, but no phenylmethylolide (1 6200) is formed (1) (for use of this

conversion to remove  $\bar{C}$  from mixtures with styrene dichloride (3:6685) see (7) (8).—However,  $\bar{C}$  with NaOEt gives (yield not reported (1)) cf. (3) ethyl  $\beta$ -hydroxy- $\beta$ -phenylethyl ether [Beil. VI-907], h.p. 242–243°.]

[C on dehydration by passing over  $\text{HPO}_3$  on silica gel at 370–400° and 95–115 mm. press. gives (63% yield (9))  $\beta$ -chlorostyrene (3:8717).]

[ $\bar{C}$  on passing over activated  $Al_2O_3$  at 360–390° and 115–125 mm. press. gives (67% yield (9)) acetophenone (1:5515), but  $\bar{C}$  on passing over  $CaCO_3$  on silica gel at 325–350° and 105–125 mm. press. gives (51% yield (9)) phenylacetaldehyde (1:0200).]

$\bar{C}$  with pyridine at 120° for 6 hrs. gives in quant. yield (10) the corresp. quaternary pyridinium salt; m.p. 210–212° dec., sol. in aq., MeOH, EtOH, but spar. sol. in other org. solvents.

$\bar{C}$  on oxidn. with  $K_2Cr_2O_7/H_2SO_4/AcOH$  at low temp. (1) cf. (4) gives (84% yield (4))  $\omega$ -chloroacetophenone (phenacyl chloride) (3:1212).

—Chloromethyl-phenyl-carbinyl acetate: b.p. 101–104° at 3 mm.,  $n_D^{25} = 1.5182$  (4).  
[From **C** with  $\text{Ac}_2\text{O}$  + pyridine (66% yield (4)).]

— Chloromethyl-phenyl-carbinyl benzoate: unreported.

① Chloromethyl-phenyl-carbinyl *p*-nitrobenzoate: m.p. 81° (4). [From **C** with *p*-nitrobenzoyl chloride in pyridine (4).]

— Chloromethyl-pbenyl-carbinyl 3,5-dinitrobenzoate: unreported.

## 3:9576 SUBERYL (DI)CHLORIDE

Beil. II - 694

II<sub>1</sub>-(287)

И<sub>2</sub>-(596)

B.P. 162-163° at 15 mm., sl. dec. (1)

159–160° at 12 mm. (2)

149–150° at 12 mm. (3)

147° at 12 mm. (4)

143-147° at 12 mm. (5)

$$D_1^{208} = 1.1718(3) \quad n_D^{208} = 1.46847(3)$$

[For prepn. of  $\tilde{C}$  from suberic acid (I:0755) with  $PCl_5$  (1), with  $PCl_3$  (4), or with  $SOCl_2$  (yield: 100% (2) (3) (5) (6) (8) (10) see indic. refs.)

[C with excess MeOH yields (6) dimethyl suberate (I:4186), b.p. 268°. C with 1 mole MeOH should yield 7-carhomethoxyheptanoyl chloride-1, b.p. 163-165° at 34 mm. (7), usually prep'd. from methyl hydrogen suberate with  $\text{SOCl}_2$  (7).]

$\bar{C}$  with excess phenol htd. at 100° yields (8) diphenyl suberate, m p. 70–71° (8).

With dry disodium suberate yields (I) suberic anhydride, m.p. 65–66° (I), presumably the linear polymeric suberic  $\alpha$ -anhydride (cf. 1:0755).

$\bar{C}$  with  $AlCl_3$  +  $C_6H_6$  yields (I) (4) 1,8-diphenyloctanedione-1,8, m.p.  $85^\circ$  (4),  $83-85^\circ$  (I) (dioxime, m.p.  $192-193^\circ$  (1)).

[C on cat. hydrogenation over Pd/diatomaceous earth as directed (9) yields suberic dialdehyde (octanedial-1,8), (*bis*-oxime, m.p. 152° (9), *bis*-phenylhydrazone, m.p. 84–86° u.c. (9), *bis*-semicarbazone, m.p. 183–185° (9)) cf. (2).]

$\bar{C}$  converted to  $\text{RMgCl}$  (as above) and treated with ethereal  $\text{HgCl}_2$  gives (35% yield) (1) 2,2,3,3-tetramethylbutyl mercuric chloride, feathery white cryst., m.p.  $170-171^\circ$  (1).

3:0945 (1) Whitmore, Marker, Plambeck, *J. Am. Chem. Soc.* 63, 1626-1630 (1941).

3:0960 4-CHLORO-2-HYDROXYBENZALDEHYDE  $\text{C}_7\text{H}_5\text{O}_2\text{Cl}$  Beil. No. 744  
(4-Chlorosalicylaldehyde)

M.P.  $52.5^\circ$  (1)

Long colorless ndls. from alc. or dil.  $\text{AcOH}$  (1). —  $\bar{C}$  has odor of walnuts (1). —  $\bar{C}$  is apprec. sol. in aq. or aq.  $\text{H}_2\text{SO}_3$ ; readily sol. in org. solvents. —  $\bar{C}$  is very volatile with steam even from its yel. soln. in alk. (1).

[For prepn. of  $\bar{C}$  from *m*-chlorophenol (3.0255) via Reimer-Tiemann procedure see (1).]

$\bar{C}$  does not reduce  $\text{NH}_4\text{OH}/\text{AgNO}_3$  or Fehling soln.; is very resistant to oxidn. by acid, alk., or neutral  $\text{KMnO}_4$ , and to acetylation (but not benzylation, q.v. below) (1).

$\bar{C}$  with  $\text{FeCl}_3$  gives brown ppt., with  $\text{CuSO}_4$  or  $\text{Cr}_2(\text{SO}_4)_3$  + dil. aq. alk. gives bright green copper salt and a dark green chromium salt (1).

$\bar{C}$  on mononitration as specified (2) yields 5-nitro-4-chloro-2-hydroxybenzaldehyde, pale yel. ndls. from alc., m.p.  $116^\circ$  (2) [This product yields a phenylhydrazone, or.-yel. ndls., m.p.  $188^\circ$  dec.; a *p*-nitrophenylhydrazone, brn.-yel. ndls. from alc. or  $\text{AcOH}$ , m.p.  $204^\circ$  dec.; and a semicarbazone, pale yel. ndls. from dil.  $\text{AcOH}$ , dec. above  $300^\circ$  (2).]

$\bar{C}$  on dinitration as specified (2) yields 3,5-dinitro-4-chloro-2-hydroxybenzaldehyde, pale gold.-yel. ndls. from aq., m.p.  $153^\circ$  (2). [This product yields a phenylhydrazone, light brn. cryst. from alc., m.p.  $219^\circ$ ; a *p*-nitrophenylhydrazone, light brn. cryst. from dil.  $\text{AcOH}$ , m.p.  $236^\circ$  dec.; and a semicarbazone, light yel. cryst. from dil.  $\text{AcOH}$ , m.p.  $225^\circ$  dec. (2).]

① 4-Chloro-2-hydroxybenzaldehyde: colorless ndls. from alc., m.p.  $155^\circ$  (1).

② 4-Chloro-2-hydroxybenzaldehyde *p*-nitrophenylhydrazone: or. ndls. from  $\text{AcOH}$ , m.p.  $257^\circ$  (1).

③ 4-Chloro-2-hydroxybenzaldehyde semicarbazone: pale yel. cryst. from  $\text{AcOH}$ , m.p.  $212^\circ$  (1).

④ 4-Chloro-2-benzoylbenzaldehyde: from  $\bar{C}$  +  $\text{BzCl}$  in ether + pyridine; ndls. from alc., m.p.  $98.5^\circ$  (1)

3:0960 (1) Hodgson, Jenkinson, *J. Chem. Soc.* 1927, 1740-1741. (2) Hodgson, Jenkinson, *J. Chem. Soc.* 1928, 2273-2274.

3:9590 8-CHLORO-OCTANOL-1  $\text{CH}_2(\text{CH}_2)_6\text{CH}_2\text{OH}$   $\text{C}_8\text{H}_{17}\text{OCl}$  Beil. S.N. 24  
 ( $\omega$ -Chloro-*n*-octyl alcohol)  
 $\begin{array}{c} | \\ \text{Cl} \end{array}$

B.P. 139° at 18.5 mm. (1)

125-140° at 18 mm. (2)

[For prepn. of  $\bar{\text{C}}$  from  $\alpha, \omega$ -octamethylene glycol (m.p. 63°, b.p. 167-168° at 18 mm. (2)) with conc. HCl as directed (yields: 81% (2), 75% (1), 65% (3)) see indic. refs.]

$\bar{\text{C}}$  with thiophenol in aq. NaOH htd. 3 hrs. gives (2) 8-hydroxy-*n*-octyl phenyl sulfide, pl from lt. pet., m.p. 55° [this prod. with  $\text{SOCl}_2$  gives (2) 8-chloro-*n*-octyl phenyl sulfide, cryst. from aq. alc. at low temp., m.p. 16°].

[ $\bar{\text{C}}$  (1 mole) with  $\text{Et}_3\text{NH}$  (3-4 moles) in s.t. at 120-160° for 12-15 hrs. gives (88% yield (1)) 8-(diethylamino)octanol-1, b.p. 151° at 12 mm.,  $D_4^{15.5} = 0.8610$ ,  $n_D^{19} = 1.4570$  (1) cf. (5) (corresp. *p*-nitrobenzoate, m.p. 74° (1)); this prod. with  $\text{SOCl}_2$  in  $\text{C}_6\text{H}_6$  yields (1) (5) 8-(diethylamino)-*n*-octyl chloride, b.p. 130.5° at 11 mm.,  $n_D^{18} = 1.4535$  (1) cf. (5) (corresp.  $\bar{\text{B}}\cdot\text{HCl}$ , m.p. 73° (5)).]

$\bar{\text{C}}$  with morpholine gives (4) alm. quant. 8-(4-morpholinyl)octanol-1, b.p. 164.0-164.2° at 5 mm.,  $D_4^{25} = 0.9675$ ,  $n_D^{27} = 1.4735$  (corresp. *N*-( $\alpha$ -naphthyl)carbamate, m.p. 73.0-74.0° cor.) —  $\bar{\text{C}}$  (1 mole) with *N*-phenylpiperazine (2 moles) at 100° for 5 hrs. gives (3) in alm. 100% yield (as salt) *N*-(8-hydroxy-*n*-octyl)-*N'*-phenylpiperazine, m.p. 57.0-58.5° cor. (corresp. *N*-phenylcarbamate, m.p. 99.5-100.5° cor.) note that this free base readily absorbs aq. from air to form a monohydrate, m.p. 80-82° (3).

① 8-Chloro-*n*-octyl *N*-phenylcarbamate: ndls from aq. alc., m.p. 77° (2).

② 8-Chloro-*n*-octyl *N*-(*m*-nitrophenyl)carbamate: m.p. 62° (1).

3:9792 METHYL  $\omega$ -(CHLOROFORMYL)PELARGONATE

Beil. S.N. 178

( $\omega$ -(Carbomethoxy)pelargonyl chloride)

B.P. 177°	at 23 mm. (1)
158-160°	at 10 mm. (2)

Note that  $\bar{C}$  is both an acid chloride and an ester.

[For prepn. of  $\bar{C}$  from methyl hydrogen sebacate (itself obtd. (52-61% (2)) from sebacic acid (1:0730) + MeOH (1:6120)) by action of  $SOCl_2$  (yields: 83-86% (2), 60-70% (1)) see indic. refs.]

⑤  $\omega$ -(Carbomethoxy)pelargonamide (methyl sebacamate): cryst. from aq., m.p. 77.4° (3), 72-74° (2). [From  $\bar{C}$  with conc. aq.  $\text{NH}_4\text{OH}$  at 8° (yields: 93-95% (2), 90% (3)); for dehydration of this prod. (64-71% yield) (3) with  $\text{P}_2\text{O}_5$  in acetylene tetrachloride to methyl  $\omega$ -cyanopelargonate, b.p. 170° at 14 mm.,  $n_D^{25} = 1.4398$  (3), and use of latter in prepn. of high-mol.-wt. linear polymers (4), see indic. refs.]

3:9792 (1) Morgan, Walton, *J. Chem. Soc.* 1936, 904. (2) Bishop, *Org. Syntheses* 25, 71-72 (1945). (3) Biggs, Bishop, *J. Am. Chem. Soc.* 63, 944 (1941). (4) Bishop (to Bell Telephone Laboratories, Inc.), U.S. 2,277,033, March 24, 1942; *C.A.* 36, 4636 (1942).

3:9800 *n*-UNDECANOYL CHLORIDE  $\cdot \text{C}_{10}\text{H}_{21}\text{OCl}$  Beil. S.N. 162  
(*n*-Hendecanoyl chloride)  $\text{CH}_3(\text{CH}_2)_9\text{C}=\text{O}$

B.P. 119-120° at 40 mm. (1)  
123° at 11 mm. (2)  
90° at 1 mm. (3)

$n_D^{25} = 1.4465$  (3)

Care must be taken to avoid confusion of  $\bar{C}$  with *n*-undecyl chloride (1-chloroundecane) (3:8803).

[For prepn. of  $\bar{C}$  from *n*-undecylic acid (1:0573) with  $\text{SOCl}_2$  (yield: 95.5% (1)) (3) (4) see indic. refs.]

[ $\bar{C}$  with  $\text{C}_6\text{H}_6 + \text{AlCl}_3$  should give *n*-undecyl phenyl ketone, but this compd. is unreported in the literature. —  $\bar{C}$  with toluene (1:7405) +  $\text{AlCl}_3$  gives (80% yield (5)) *n*-undecyl *p*-tolyl ketone, m.p. 32°, b.p. 196-197° at 12 mm. (7)]

[ $\bar{C}$  with MeOH presumably gives methyl *n*-undecylate [Beil. II<sub>1</sub>-(154), II<sub>2</sub>-(314)], b.p. 123° at 9-10 mm. (6); similarly,  $\bar{C}$  with EtOH presumably gives ethyl *n*-undecylate [Beil. II-358, II<sub>1</sub>-(154)] (known in polymorphic forms for which see (7) (8) (9)); note, however, that prepn. of these esters by this means is not actually reported in the literature.]

[ $\bar{C}$  with phenol presumably gives phenyl *n*-undecylate, but neither this cpd. nor either of the *n*-undecyl hydroxyphenyl ketones to be expected from its rearr. with  $\text{AlCl}_3$  is reported in the literature. — However, for reaction of  $\bar{C}$  with hydroquinone (1:1590) see (19).]

[ $\bar{C}$  with sodium undecylate on htg. presumably gives undecylic anhydride, m.p. 36.7° (11), 35° (12), but this cpd. is actually reported only by other methods (11) (12).]

[For reaction of  $\bar{C}$  with diethyl sodioacetosuccinate [Beil. III-801, III<sub>1</sub>-(280), III<sub>2</sub>-(486)] and subsequent hydrolysis of prod. to  $\gamma$ -ketomyristic acid see (4).]

[ $\bar{C}$  with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (2) cf. (13) *N*-(vanillyl)-myristamide,  $\alpha$ -form, m.p. 69.5° (2);  $\beta$ -form, m.p. 62.0-62.5° (2); the m.p. of 54-56° reported earlier (13) may have been a mixture, but that of 73-74° by other workers (14) is unexplained.]

$\bar{C}$  on hydrolysis yields undecylic acid (1:0573), m.p. 29.3°; for the amide, anilide, *p*-toluidide, and other derivatives corresp. to  $\bar{C}$  see undecylic acid (1:0573).

$\bar{C}$  is widely used as anti-moth agent and vapor fumigant but lit. and patents are so numerous that they cannot be included here; note, however, prevention of caking of  $\bar{C}$  by mixt. with 1-10% paraformaldehyde (43). — [For study of toxicity of  $\bar{C}$  see (44). — For use of  $\bar{C}$  in prepn. of sulfur dyes see (45).]

[For detn. of  $\bar{C}$  in air see (46); for detn. of  $\bar{C}$  in soil by means of detn. of refractive index of solns. in kerosene see (47).]

[For prepn. of  $\bar{C}$  from *p*-chloroaniline [Beil. XII-607, XII<sub>1</sub>-(304)] via diazotization, prepn. of diazonium/ $ZnCl_2$  double salt, and decompn. of latter in molten phenol (41% yield  $\bar{C}$  together with 31% hydroxybiphenyl + 15% diphenyl ether) see (48); from *p*-phenylenediamine [Beil. XIII-61, XIII<sub>1</sub>-(18)] via tetrazotization in AcOH (49) or  $H_3PO_4$  (50) with nitrosylsulfuric acid followed by subsequent reactn. with  $Cu_2Cl_2$  (yield: 70% (49) (50)) cf. (51), or by reduction with  $SnCl_2/HCl$  to *p*-phenylenedihydrazine and oxidn. with  $CuSO_4$  (52), see indic. refs.]

[For prepn. of  $\bar{C}$  from *p*-chloro-nitrobenzene [Beil. V-243, V<sub>1</sub>-(130)] with conc. HCl in s.t. at 270° (53), or with  $SOCl_2$  in s.t. at 160-200° (54) (55), see indic. refs.; from *p*-bromonitrobenzene [Beil. V-243, V<sub>1</sub>-(132)] (56), phenol-*p*-sulfonic acid [Beil. XI-241, XI<sub>1</sub>-(55)] (57), or *p*-chlorophenol (3:0475) (16) with  $PCl_5$  on hgt. see indic. refs.; from *p*-chlorobenzenesulfonic acid [Beil. XI-54, XI<sub>1</sub>-(14)] with  $SOCl_2$  in s.t. at 160-200° see (54) (55); from 2,5-dichlorobenzophenone (3:2340) by fusion with KOH/NaOH (65% yield) see (58); from di-*p*-chlorophenyl sulfide or di-*p*-chlorophenyl sulfoxide with S at 260-270° for 3-8 hrs. see (59); from *p*-chlorophenyl selenium trichloride by hgt. at 164° (90% yield) see (12).]

[For formn. of  $\bar{C}$  (together with *o*- and *m*-isomers in some cases) from  $C_6H_6$  with  $Cl_2$  in pres. of  $I_2$  (16),  $MoCl_5$  (60),  $AlCl_3$  (61), or conc.  $H_2SO_4$  (62), by electrolysis of susp. in AcOH + aq. HCl (69) or with aqua regia (70), see indic. refs.; from chlorobenzene (3:7903) with  $Cl_2$  + cat. at 600° (17) cf. (63), or with  $Cl_2$  in pres. of  $AlCl_3$  (65% yield (27)),  $FeCl_3$  (55% yield (27)), or Al/Hg (66), see indic. refs.; from chlorobenzene (3:7903) with  $Al_2S_2Cl_3$  (i.e.,  $2AlCl_3 + S_2Cl_2$  (64)) +  $SO_2Cl_2$  (64) (65), or by boulg. with  $FeCl_3$  (67), or in small amt. by hgt. with  $PbCl_4 \cdot 2NH_4Cl$  in s.t. at 210° (68), see indic. refs.]

[ $\bar{C}$  with  $Cl_2$  (61) in pres. of Al/Hg (66) or  $\bar{C}$  with  $Al_2S_2Cl_3$  (i.e.,  $2AlCl_3 + S_2Cl_2$ ) +  $SO_2Cl_2$  (64) gives (58% yield (64)) 1,2,4-trichlorobenzene (3:6420);  $\bar{C}$ , however, chlorinates less readily than *o*-dichlorobenzene (3:6035), and if their mixture or eutectic is chlorinated residual  $\bar{C}$  can be separated by fractional freezing (71) (72) (73). —  $\bar{C}$  with  $Cl_2$  in pres. of Fe (74) or with  $Al_2S_2Cl_3$  (i.e.,  $2AlCl_3 + S_2Cl_2$ ) +  $SO_2Cl_2$  as directed (64) gives (yields: 67% (64), 39% (74)) (75) 1,2,4,5-tetrachlorobenzene (3:4115). —  $\bar{C}$  with liq.  $Cl_2$  + sunlight + cat. (76) (77) or  $\bar{C}$  in  $CCl_4$  under 1% aq. NaOH in sunlight (76) adds  $3Cl_2$  yielding a mixt. of  $\beta$ - (m.p. 262° (76)) and  $\alpha$ - (m.p. 89.6° (76)) *p*-dichlorobenzene hexachlorides (use as insecticide (77)). — For study of photochem. chlorination of  $\bar{C}$  see (78).]

[ $\bar{C}$  when pure can be recovered unchanged after boiling with liq.  $Br_2$  (79); however,  $\bar{C}$  warmed with  $Br_2$  in pres. of Fe (79) or htd. with  $Br_2 + NaNO_2$  + fung.  $H_2SO_4$  in s.t. at 200° for 4 hrs. (80) gives (19% yield (79)) 2,5-dibromo-1,4-dichlorobenzene, ndls. from hot alc., m.p. 148° (79), 146° (80). —  $\bar{C}$  with excess  $Br_2 + AlCl_3$  as directed (81) gives 2,3,5,6-tetrabromo-1,4-dichlorobenzene, m.p. 278-278.5° (81) ]

[ $\bar{C}$  passed over Pt spiral at bright red heat yields (82) 2,5,2',5'-tetrachlorobiphenyl, m.p. 84-85° (82). —  $\bar{C}$  in EtOH at 55° in pres. of Adams' cat. ( $PtO_2$ ) with excess  $H_2$  at 3 atm. press. yields (83) cyclohexane (1:8405). —  $\bar{C}$  in alc. KCN with  $NiCl_2$  htd. in s.t. 20 hrs. at 260-270° gives (12% yield (84)) terephthalic acid (1:0910).]

[ $\bar{C}$  with Na + *n*-butyl chloride (3:7160) in xylene at 150° gives small yield (85) *p*-di-*n*-butylbenzene, b.p. 224-225.5° at 759 mm. (85). —  $\bar{C}$  with Mg +  $I_2$  (0.23 equiv.) gives in 6 hrs. 58% yield (86) *p*-chlorophenyl  $MgCl$ .]

$\bar{O}$  has also been much employed in the prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text.

With phenols.  $\bar{O}$  on hgt. with phenols splits out HCl yielding the corresp. esters. [E.g.,  $\bar{O}$  with phenol (1:1420) gives (6) phenyl laurate, m.p. 24.5° (6), h.p. 210° at 15 mm. (6), 159–161° at 1 mm. (35);  $\bar{O}$  with p-cresol (1:1410) gives (6) p-tolyl laurate, m.p. 28° (6), h.p. 219.5° at 15 mm. (6). —  $\bar{O}$  (2 moles) with pyrocatechol (1:1520) at 110° for 2 hrs. gives (36) pyrocatechol dilaurate, m.p. 35.5°;  $\bar{O}$  (2 moles) with resorcinol (1:1530) at 110° for 2 hrs. gives (36) resorcinol dilaurate, m.p. 43–44.6°;  $\bar{O}$  (2 moles) with hydroquinone (1:1590) at 110° for 2 hrs. gives (36) hydroquinone dilaurate, m.p. 85–86°.]

[ $\bar{O}$  with phenol (1:1420) +  $AlCl_3$  in sym.-tetrachloroethane (3:6760) as solvent, however, gives (37) (35) (38) a mixt. of the corresp. hydroxylauropenones; viz., 32.6% yield (37) o-hydroxyphenyl undecyl ketone, m.p. 44–45.5° (corresp. 2,4-dinitrophenylhydrazones, m.p. 92–93°) and 24.6% yield (37) p-hydroxyphenyl undecyl ketone, m.p. 71–72° (corresp. 2,4-dinitrophenylhydrazones, m.p. 150–161°); for study of influence upon o/p ratio of use of nitrobenzene and  $CS_2$  as solvents see (38); for prepn. of these hydroxylauropenones from phenyl laurate by  $BF_3$  rearr. see (39); for their methyl ethers see (44).]

With salts of organic acids. [ $\bar{O}$  with Na laurate at 100° with protection from moist air gives (40) lauric anhydride (1:0601), m.p. 44° (41), 42.1° (42), 41.8° (43), 41° (40), but the latter is usually prepd. from lauric acid (1:0605) by hgt. with  $Ac_2O$  (41) (42) (43).]

With Grignard reagents.  $\bar{O}$  with  $RMgX$  reagents derived from tertiary halides not only undergoes the normal reaction to give the corresp. secondary alcohol but also suffers reduction [e.g.,  $\bar{O}$  with *ter*-BuMgCl gives (7) the expected 2,2-dimethyltetradecanol-3 (67% yield) together with lauryl alc. (1:5900) (13.7%) and *ter*-hutyl-undecyl-carbinyl laurate (10.4%); similarly,  $\bar{O}$  with *ter*-AmMgCl gives (7) lauryl alc. (1:5900) (54.8%) and 3,3-dimethylpentadecanol-4 (17.7%)].

With organic amines.  $\bar{O}$  with organic prim. amines gives (8) (9) (10) (11) (12) (13) (14) (15) (16) (17) (18) (19) (20) (21) (22) (23) (24) (25) (26) (27) (28) (29) (30) (31) (32) (33) (34) (35) (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) (46) (47) (48) (49) (50) (51) (52) (53) (54) (55) (56) (57) (58) (59) (60) (61) (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (72) (73) (74) (75) (76) (77) (78) (79) (80) (81) (82) (83) (84) (85) (86) (87) (88) (89) (90) (91) (92) (93) (94) (95) (96) (97) (98) (99) (100) (101) (102) (103) (104) (105) (106) (107) (108) (109) (110) (111) (112) (113) (114) (115) (116) (117) (118) (119) (120) (121) (122) (123) (124) (125) (126) (127) (128) (129) (130) (131) (132) (133) (134) (135) (136) (137) (138) (139) (140) (141) (142) (143) (144) (145) (146) (147) (148) (149) (150) (151) (152) (153) (154) (155) (156) (157) (158) (159) (160) (161) (162) (163) (164) (165) (166) (167) (168) (169) (170) (171) (172) (173) (174) (175) (176) (177) (178) (179) (180) (181) (182) (183) (184) (185) (186) (187) (188) (189) (190) (191) (192) (193) (194) (195) (196) (197) (198) (199) (200) (201) (202) (203) (204) (205) (206) (207) (208) (209) (210) (211) (212) (213) (214) (215) (216) (217) (218) (219) (220) (221) (222) (223) (224) (225) (226) (227) (228) (229) (230) (231) (232) (233) (234) (235) (236) (237) (238) (239) (240) (241) (242) (243) (244) (245) (246) (247) (248) (249) (250) (251) (252) (253) (254) (255) (256) (257) (258) (259) (260) (261) (262) (263) (264) (265) (266) (267) (268) (269) (270) (271) (272) (273) (274) (275) (276) (277) (278) (279) (280) (281) (282) (283) (284) (285) (286) (287) (288) (289) (290) (291) (292) (293) (294) (295) (296) (297) (298) (299) (300) (301) (302) (303) (304) (305) (306) (307) (308) (309) (310) (311) (312) (313) (314) (315) (316) (317) (318) (319) (320) (321) (322) (323) (324) (325) (326) (327) (328) (329) (330) (331) (332) (333) (334) (335) (336) (337) (338) (339) (340) (341) (342) (343) (344) (345) (346) (347) (348) (349) (350) (351) (352) (353) (354) (355) (356) (357) (358) (359) (360) (361) (362) (363) (364) (365) (366) (367) (368) (369) (370) (371) (372) (373) (374) (375) (376) (377) (378) (379) (380) (381) (382) (383) (384) (385) (386) (387) (388) (389) (390) (391) (392) (393) (394) (395) (396) (397) (398) (399) (400) (401) (402) (403) (404) (405) (406) (407) (408) (409) (410) (411) (412) (413) (414) (415) (416) (417) (418) (419) (420) (421) (422) (423) (424) (425) (426) (427) (428) (429) (430) (431) (432) (433) (434) (435) (436) (437) (438) (439) (440) (441) (442) (443) (444) (445) (446) (447) (448) (449) (450) (451) (452) (453) (454) (455) (456) (457) (458) (459) (460) (461) (462) (463) (464) (465) (466) (467) (468) (469) (470) (471) (472) (473) (474) (475) (476) (477) (478) (479) (480) (481) (482) (483) (484) (485) (486) (487) (488) (489) (490) (491) (492) (493) (494) (495) (496) (497) (498) (499) (500) (501) (502) (503) (504) (505) (506) (507) (508) (509) (510) (511) (512) (513) (514) (515) (516) (517) (518) (519) (520) (521) (522) (523) (524) (525) (526) (527) (528) (529) (530) (531) (532) (533) (534) (535) (536) (537) (538) (539) (540) (541) (542) (543) (544) (545) (546) (547) (548) (549) (550) (551) (552) (553) (554) (555) (556) (557) (558) (559) (560) (561) (562) (563) (564) (565) (566) (567) (568) (569) (570) (571) (572) (573) (574) (575) (576) (577) (578) (579) (580) (581) (582) (583) (584) (585) (586) (587) (588) (589) (590) (591) (592) (593) (594) (595) (596) (597) (598) (599) (600) (601) (602) (603) (604) (605) (606) (607) (608) (609) (610) (611) (612) (613) (614) (615) (616) (617) (618) (619) (620) (621) (622) (623) (624) (625) (626) (627) (628) (629) (630) (631) (632) (633) (634) (635) (636) (637) (638) (639) (640) (641) (642) (643) (644) (645) (646) (647) (648) (649) (650) (651) (652) (653) (654) (655) (656) (657) (658) (659) (660) (661) (662) (663) (664) (665) (666) (667) (668) (669) (670) (671) (672) (673) (674) (675) (676) (677) (678) (679) (680) (681) (682) (683) (684) (685) (686) (687) (688) (689) (690) (691) (692) (693) (694) (695) (696) (697) (698) (699) (700) (701) (702) (703) (704) (705) (706) (707) (708) (709) (710) (711) (712) (713) (714) (715) (716) (717) (718) (719) (720) (721) (722) (723) (724) (725) (726) (727) (728) (729) (730) (731) (732) (733) (734) (735) (736) (737) (738) (739) (740) (741) (742) (743) (744) (745) (746) (747) (748) (749) (750) (751) (752) (753) (754) (755) (756) (757) (758) (759) (760) (761) (762) (763) (764) (765) (766) (767) (768) (769) (770) (771) (772) (773) (774) (775) (776) (777) (778) (779) (780) (781) (782) (783) (784) (785) (786) (787) (788) (789) (790) (791) (792) (793) (794) (795) (796) (797) (798) (799) (800) (801) (802) (803) (804) (805) (806) (807) (808) (809) (810) (811) (812) (813) (814) (815) (816) (817) (818) (819) (820) (821) (822) (823) (824) (825) (826) (827) (828) (829) (830) (831) (832) (833) (834) (835) (836) (837) (838) (839) (840) (841) (842) (843) (844) (845) (846) (847) (848) (849) (850) (851) (852) (853) (854) (855) (856) (857) (858) (859) (860) (861) (862) (863) (864) (865) (866) (867) (868) (869) (870) (871) (872) (873) (874) (875) (876) (877) (878) (879) (880) (881) (882) (883) (884) (885) (886) (887) (888) (889) (890) (891) (892) (893) (894) (895) (896) (897) (898) (899) (900) (901) (902) (903) (904) (905) (906) (907) (908) (909) (910) (911) (912) (913) (914) (915) (916) (917) (918) (919) (920) (921) (922) (923) (924) (925) (926) (927) (928) (929) (930) (931) (932) (933) (934) (935) (936) (937) (938) (939) (940) (941) (942) (943) (944) (945) (946) (947) (948) (949) (950) (951) (952) (953) (954) (955) (956) (957) (958) (959) (960) (961) (962) (963) (964) (965) (966) (967) (968) (969) (970) (971) (972) (973) (974) (975) (976) (977) (978) (979) (980) (981) (982) (983) (984) (985) (986) (987) (988) (989) (990) (991) (992) (993) (994) (995) (996) (997) (998) (999) (1000) (1001) (1002) (1003) (1004) (1005) (1006) (1007) (1008) (1009) (1010) (1011) (1012) (1013) (1014) (1015) (1016) (1017) (1018) (1019) (1020) (1021) (1022) (1023) (1024) (1025) (1026) (1027) (1028) (1029) (1030) (1759) (1760) (1761) (1762) (1763) (1764) (1765) (1766) (1767) (1768) (1769) (1770) (1771) (1772) (1773) (1774) (1775) (1776) (1777) (1778) (1779) (1780) (1781) (1782) (1783) (1784) (1785) (1786) (1787) (1788) (1789) (1790) (1791) (1792) (1793) (1794) (1795) (1796) (1797) (1798) (1799) (1800) (1801) (1802) (1803) (1804) (1805) (1806) (1807) (1808) (1809) (1810) (1811) (1812) (1813) (1814) (1815) (1816) (1817) (1818) (1819) (1820) (1821) (1822) (1823) (1824) (1825) (1826) (1827) (1828) (1829) (1830) (1831) (1832) (1833) (1834) (1835) (1836) (1837) (1838) (1839) (1840) (1841) (1842) (1843) (1844) (1845) (1846) (1847) (1848) (1849) (1850) (1851) (1852) (1853) (1854) (1855) (1856) (1857) (1858) (1859) (1860) (1861) (1862) (1863) (1864) (1865) (1866) (1867) (1868) (1869) (1870) (1871) (1872) (1873) (1874) (1875) (1876) (1877) (1878) (1879) (1880) (1881) (1882) (1883) (1884) (1885) (1886) (1887) (1888) (1889) (1890) (1891) (1892) (1893) (1894) (1895) (1896) (1897) (1898) (1899) (1900) (1901) (1902) (1903) (1904) (1905) (1906) (1907) (1908) (1909) (1910) (1911) (1912) (1913) (1914) (1915) (1916) (1917) (1918) (1919) (1920) (1921) (1922) (1923) (1924) (1925) (1926) (1927) (1928) (1929) (1930) (1931) (1932) (1933) (1934) (1935) (1936) (1937) (1938) (1939) (1940) (1941) (1942) (1943) (1944) (1945) (1946) (1947) (1948) (1949) (1950) (1951) (1952) (1953) (1954) (1955) (1956) (1957) (1958) (1959) (1960) (1961) (1962) (1963) (1964) (1965) (1966) (1967) (1968) (1969) (1970) (1971) (1972) (1973) (1974) (1975) (1976) (1977) (1978) (1979) (1980) (1981) (1982) (1983) (1984) (1985) (1986) (1987) (1988) (1989) (1990) (1991) (1992) (1993) (1994) (1995) (1996) (1997) (1998) (1999) (2000) (2001) (2002) (2003) (2004) (2005) (2006) (2007) (2008) (2009) (2010) (2011) (2012) (2013) (2014) (2015) (2016) (2017) (2018) (2019) (2020) (2021) (2022) (2023) (2024

Note that care must be taken to avoid confusion of  $\bar{C}$  with *n*-lauryl chloride (1-chlorododecane) (3:8810).

### PREPARATION OF $\bar{C}$

[For prepn. of  $\bar{C}$  from *n*-lauric acid (1:0605) with  $\text{PCl}_5$  (yields: 91.5% (10), 66% (13)) (6) (15) (32), with  $\text{PCl}_5 + \text{ZnCl}_2$  (45% yield (13)), with  $\text{PCl}_3$  (yields: 80% (8), 72% (13)) (4) (16), with  $\text{PCl}_3 + \text{ZnCl}_2$  (79% yield (13)), with  $\text{SOCl}_2$  (yields: 92% (9), 80–84% (11), 83% (13), 80% (20)) (1) (5) (17) (32) (33), with oxalyl (di)chloride (3:5060) (99% yield (3)) (2), or with carbonyl chloride (phosgene) (3:5000) at 140–150° (85–90% yield (18)) see indic. refs.]

[For prepn. of  $\bar{C}$  from  $\alpha,\beta$ -dichloroethyl laurate (19) on distn. with 0.1%  $\text{ZnCl}_2$  (chloroacetaldehyde (3:7212) is also formed) see (19).]

### CHEMICAL BEHAVIOR OF $\bar{C}$

#### BEHAVIOR WITH INORGANIC REACTANTS

Hydrogenation of  $\bar{C}$ . [ $\bar{C}$  with  $\text{H}_2 + \text{Pt}$  cat. at 200–320° and 50–180 mm. or with  $\text{H}_2 + \text{Raney Ni}$  at 160° and 50 mm. *fails* (8) to give the expected lauraldehyde (1:0017); this result is apparently due to side reactions of the latter since undecane (1:8820) and tricosane,  $\text{C}_{23}\text{H}_{48}$ , were isolated (8).]

Behavior with sodium. [ $\bar{C}$  (1 mole) with metallic sodium (1.2 moles) in dry ether refluxed (with stirring) for 4 hrs. gives (60% yield (20)) tetracosen-12-diol-12,13 dilaurate, i.e., the dilaurate ester of  $\text{CH}_3(\text{CH}_2)_{10}\text{C}(\text{OH})=\text{C}(\text{OH})(\text{CH}_2)_{10}\text{CH}_3$ , *cryst.* from acetone/ $\text{C}_6\text{H}_6$  (3:1), m.p. 42–43° (20)]

Behavior with  $\text{Na}_2\text{O}_2$ . [ $\bar{C}$  with aq.  $\text{Na}_2\text{O}_2$  below 50° gives (21) dilauroyl peroxide, but no constants for either this prod. or for lauroyl hydrogen peroxide can be found in the literature; for use of dilauroyl peroxide as cat. for drying oils see (22).]

Behavior with  $\text{NaN}_3$ . [ $\bar{C}$  with  $\text{NaN}_3$  in  $\text{C}_6\text{H}_6$  reacts to give lauroyl azide (not isolated (23)), which loses  $\text{N}_2$  and rearr. giving (81–86% yield (23)) undecyl isocyanate, b.p. 103° at 3 mm. (23).]

#### BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons. [ $\bar{C}$  with  $\text{C}_6\text{H}_6 + \text{AlCl}_3$  gives (yields: 100% (14), 71% (11)) (24) (25) (26) (27) phenyl undecyl ketone (laurophenone) [Beil. VII-345, VII-(186)], m.p. 47° (24) (28), 46° (14) (25), 45° (26), 44–45° (11); b.p. 222–223° at 21 mm. (25), 201–202° at 9 mm. (26), 193–194° at 9 mm. (11), 174° at 3 mm. (29) (corresp. oxime, m.p. 64.5° (11); semicarbazone, m.p. 98° (11); 2,4-dinitrophenylhydrazone, m.p. 101–102° (11)). — For analogous reactions of  $\bar{C}$  in pres. of  $\text{AlCl}_3$  with biphenyl (1:7175), diphenyl ether (1:7125), diphenylene oxide (1:7205), carbazole, thiophene, and furan see (30); for use of these products as waxes, addition agents for lubricants, etc., see (30) (31).]

With alcohols.  $\bar{C}$  with alcohols gives in general the corresp. alkyl laurates [e.g.,  $\bar{C}$  with  $\text{MeOH}$  gives methyl laurate, m.p. +5°, b.p. 148° at 18 mm. (10);  $\bar{C}$  with  $\text{EtOH}$  gives ethyl laurate (1:4196), m.p. –1.7 b.p. 269°; etc. —  $\bar{C}$  with benzyl alc. (1:6480) gives (32) benzyl laurate;  $\bar{C}$  with menthol (1:5940) gives (33) menthyl laurate; etc.].

$\bar{C}$  (2 moles) with dihydric alcs. on htg. gives the corresp. neutral esters [e.g.,  $\bar{C}$  with ethylene glycol (1:6465) gives (34) ethylene glycol dilaurate (1:2157), m.p. 52°;  $\bar{C}$  with propanediol-1,2 (1:6455) gives (34) propylene glycol dilaurate, m.p. 35°;  $\bar{C}$  with butanediol-1,3 (1:6482) gives (34) 1,3-butylene glycol dilaurate, m.p. about 16.5°;  $\bar{C}$  with butanediol-1,4 (1:6516) gives (34) tetramethylene glycol dilaurate, m.p. 45.5°].

[For prepn. of  $\bar{C}$  from *m*-chlorobromobenzene [Beil. V-209, V<sub>1</sub>-(115), V<sub>2</sub>-(161)] (2) by conversion to *m*-chlorophenyl MgBr (cf. (3)) and reaction with *o*-chlorobenzonitrile [Beil. IX-336] (4) (5) followed by hydrolysis (73% yield) see (1).]

① 2,3'-Dichlorobenzophenone 2,4-dinitrophenylhydrazone: m.p. 255-257° (1).

119.5-123°	at 1 mm. (11)	

Care must be taken to avoid confusion of  $\bar{C}$  with *n*-myristyl chloride (1-chlorotetradecane) (3:9874).PREPARATION OF  $\bar{C}$ 

[For prepn. of  $\bar{C}$  from myristic acid (1:0630) with  $SOCl_2$  (yields: 91% (8), 80% (3), 80-84% (9), 79% (6)) (12) (2) (13) (14) (15); with  $PCl_5$  (89% yield (6)) (7) (14); with  $PCl_3$  (11) (1) (17); with  $PCl_3 + ZnCl_2$  (79% yield (6)); or with oxalyl (di)chloride (3:5060) (10) see indic. refs.]

CHEMICAL BEHAVIOR OF  $\bar{C}$ 

## BEHAVIOR WITH INORGANIC REACTANTS

Hydrogenation of  $\bar{C}$ . [ $\bar{C}$  with  $H_2 + Pt$  cat. at 220-230° at 60-65 mm. gives (1) not only some *n*-myristaldehyde (1:0004) and its trimer but also (by loss of CO from  $\bar{C}$ ) *n*-tridecane [Beil. 1-171, I<sub>2</sub>-(134)], b.p. 234°.]

Hydrolysis of  $\bar{C}$ .  $\bar{C}$  on hydrolysis with aq. presumably yields myristic acid (1:0630) + HCl although actual record of this reaction is lacking in the literature.

Behavior with sodium. [ $\bar{C}$  (1 mole) with metallic sodium (1.2 moles) in dry ether refluxed (with stirring) for 10 hrs. gives (64% yield (3)) octacosen-14-diol-14,15 dimyristate, i.e., the dimyristate ester of  $CH_3(CH_2)_{12}C(OH)=C(OH)(CH_2)_{12}CH_3$ , cryst. from acetone/ $C_6H_6$  (3:1), m.p. 54-55° (3).]

## BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons (or their equivalents). [ $\bar{C}$  with  $C_6H_6 + AlCl_3$  in  $CS_2$  gives (69% yield (9)) phenyl *n*-tridecyl ketone (myristophenone) [Beil. VII<sub>1</sub>-(186)], m.p. 52-53°

3:9880 *o*-BENZOYL-BENZOYL CHLORIDE=A  
 3-CHLORO-3-PHENYLPHTHALIDE=B  
 (*o*-Benzoylbenzoyl *pseudo*-chloride)

$C_{14}H_9O_2Cl$  A. Beil. X-749  
 $X_1$ —  
 B. Beil. XVII-361  
 $XVII_1$ —

$\bar{C}$  appears to react in two tautomeric forms correspond to structures A and B, the independent existence of which, however, has not (as yet) been definitely established. The same method of prepn. has in various laboratories given results sometimes suggesting a preponderance of A, sometimes of the tautomer B. The constants reported for  $\bar{C}$  show a correspondingly wide variation, e.g., m p. 82–83° (1), aht. 70° (2), 59–60° (3), b p. 170–171° at 1 mm. (1); other workers, e.g. (5) (6), have sometimes obtd.  $\bar{C}$  in crystn form and sometimes not and have failed to report constants

[For prepn. of  $\bar{C}$  from *o*-benzoylbenzoic acid (1·0720) with  $PCl_5$  in  $CS_2$  (2) (3) (4) (5), or  $PCl_5$  (7),  $PCl_5$  (7) (4), or  $SOCl_2$  (7) (4) (5) (6) (1) (8) (11), see indic. refs.; for prepn. of  $\bar{C}$  from 3-phenylphthalide with  $Cl_2$  at 115–120° see (5) ]

$\bar{C}$ -A on htg. above 130° loses HCl and ring-closes yielding (9) (10) anthraquinone (1:0095).

$\bar{C}$ -A with conc. aq.  $NH_4OH$  at 0° yields (9) *o*-benzoylbenzamide, m p 165° cor. (9), with aniline yields (11) *o*-benzoylbenzanilide, m p 195° (11).

$\bar{C}$ -A with MeOH yields (2) (7) (4) methyl *o*-benzoylbenzoate, m p 51·5° (4), 51·7° (4), 51–52° (2), 52° (12);  $\bar{C}$ -B with MeOH yields (7) methyl *pseudo*-*o*-benzoylbenzoate (3-methoxy-3-phenylphthalide), m p 80–81° (7)

$\bar{C}$ -A with EtOH should yield ethyl *o*-benzoylbenzoate, m p. 58° (13) (12);  $\bar{C}$ -B with EtOH yields (14) ethyl *pseudo*-*o*-benzoylbenzoate (3-ethoxy-3-phenylphthalide), m p. 51–53° (14), 56° (13).

$\bar{C}$ -A with K phenolate or with phenol in pyridine yields (5) phenyl *o*-benzoylbenzoate, m p. 162–163° (5),  $\bar{C}$ -B under same circumstances yields phenyl *pseudo*-*o*-benzoylbenzoate (3-phenoxy-3-phenylphthalide), m.p. 80–82° (5). [For analogous behavior of other phenols see (5).]

$\bar{C}$ -B with phenol yields (6) 3-(*p*-hydroxyphenyl)-3-phenylphthalide, m p. 168–170° (6). [For analogous reactn. with other phenols and phenol ethers see (6) ]

[For reactn. of  $\bar{C}$  with  $\alpha$ -methylnaphthalene see (15).]

 $D_{25}^{25} = 0.8433$  (2)  $n_D^{25} = 1.4470$  (2)

[For prepn. of  $\bar{C}$  from *N*-benzoyl-*n*-pentadecylamine (*N*-(*n*-pentadecyl)benzamide) with  $PCl_5$  on distn. (58% yield) see (1); from *n*- $C_{12}H_{25}MgBr$  (1 mole) by reactn. in ether with  $\gamma$ -chloro-*n*-propyl *p*-toluenesulfonate (2 moles) (yield 42% on  $RMgBr$ ) (note that some 1-bromo-3-chloropropane, b.p. 138-140°, is also formed) see (2).]

[ $\bar{C}$  with excess aniline at 100° for a long time, then treated with dil. HCl, ppts. (1) *N*-(*n*-pentadecyl)aniline HCl, cryst. from alc./ether, m.p. 97° (1); free base, m.p. 36° (1).]

— *n*-Pentadecyl *p*-nitrobenzoate: m.p. 45.8° cor. (3). [Prepd. indirectly.]

— *n*-Pentadecyl 3,5-dinitrobenzoate: unreported.

— *N*-(*n*-Pentadecyl)phthalimide: unreported.

— *S*-(*n*-Pentadecyl isothiurea) picrate: unreported.

— *n*-Pentadecyl mercuric chloride: unreported.

## 3:9000 PENTADECANOYL CHLORIDE

Beil. S.N. 162

B.P. 172-176° at 10 mm. (1)

157° at 5 mm. (2)

[For prepn. of  $\bar{C}$  from pentadecanoic acid (1:0620) with  $SOCl_2$  (97% yield (1)) see (1).

[For reactn. of  $\bar{C}$  with vanillylamine see (2); with 1,7-aminonaphthol see (1).]

$\bar{C}$  on hydrolysis yields pentadecanoic acid (1:0620) q v. (for the amide, anilide, and other derivatives corresp. to  $\bar{C}$  see 1:0620).

3:9900 (1) Fierz-David, Kuster, *Helv. Chim. Acta* **22**, 86-89, 101 (1939). (2) Ford-Moore, Phillips, *Rec. trav. chim.* **53**, 857 (1934).

## — 1-CHLOROHEXADECANE

Beil. I - 172

(n-Hexadecyl chloride;

cetyl chloride)

I<sub>1</sub>—I<sub>2</sub>-(138)

B.P. 289° dec.

M.P. 15°

See 3:0015. Division A: Solids.

(corresp. oxime, m.p. 60.5°; corresp. 2,4-dinitrophenylhydrazone, m.p. 98.0-98.5°; corresp. semicarbazone, m.p. 101° (9)).]

[ $\bar{C}$  with thiophene +  $\text{SnCl}_4$  gives (yield not stated (18)) 2-furyl *n*-tridecyl ketone (2-myristolythiophene), oil, b.p. 205-210° at 4 mm.,  $D_{25}^{25} = 0.9506$ ,  $n_D^{25} = 1.4961$  (18).]

[ $\bar{C}$  with carbazole +  $\text{AlCl}_3$  gives (yield not stated (18)) 2,8-dimyristolylcarbazole, m.p. 169° (18).]

With alcohols.  $\bar{C}$  with alcohols gives in general the corresp. alkyl myristates. [E.g.,  $\bar{C}$  with MeOH gives methyl myristate (1:2013), m.p. 18.5°;  $\bar{C}$  with EtOH gives ethyl myristate (1:4316), m.p. 11.9°, b.p. 295°; etc. —  $\bar{C}$  with benzyl alc. (1:6480) gives (14) benzyl myristate;  $\bar{C}$  with menthol (1:5940) gives (15) menthyl myristate; etc.]

$\bar{C}$  (2 moles) with dihydric alcs. on htg. gives the corresp. neutral esters [e.g.,  $\bar{C}$  with ethylene glycol (1:6465) gives (20) ethylene glycol dimyristate (1:2233), m.p. 63°;  $\bar{C}$  with propanediol-1,2 (1:6455) gives (20) propylene glycol dimyristate, m.p. 41.5°;  $\bar{C}$  with butanediol-1,3 (1:6482) gives (20) 1,3-butylene glycol dimyristate, m.p. 29.5-31.0°;  $\bar{C}$  with butanediol-1,4 (1:6516) gives (20) tetramethyleneglycol dimyristate, m.p. 55°].

$\bar{C}$  has been much employed in prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text [however, for examples of use of  $\bar{C}$  with the compound of glycerol + acetone (i.e., 4-hydroxymethyl-2,2-dimethyldioxolane-1,3) in prepn. of glyceryl  $\alpha$ -monomyristate (" $\alpha$ -monomyristin") see (10) (5)].

With phenols.  $\bar{C}$  on htg. with phenols splits out  $\text{HCl}$  yielding the corresp. esters [e.g.,  $\bar{C}$  with phenol (1:1420) on htg. gives (7) phenyl myristate, m.p. 36°, b.p. 230° cor. at 15 mm. (7);  $\bar{C}$  with *p*-cresol (1:1410) on htg. gives (7) *p*-tolyl myristate, m.p. 39°, b.p. 239.5° at 15 mm. (7);  $\bar{C}$  (2 moles) with pyrocatechol (1:1520) at 110° for 2 hrs. gives (12) pyrocatechol dimyristate, m.p. 47-48°;  $\bar{C}$  (2 moles) with resorcinol (1:1530) at 110° for 2 hrs. gives (12) resorcinol dimyristate, m.p. 53°;  $\bar{C}$  (2 moles) with hydroquinone (1:1590) at 110° for 2 hrs. gives (12) hydroquinone dimyristate, m.p. 90-90.3°].

[ $\bar{C}$  with phenol (1:1420) +  $\text{AlCl}_3$  in *sym*-tetrachloroethane (3:5750) as solvent, however, gives (11) a mixt. of the corresp. hydroxymyristophenones: viz., 31.9% yield (11) *o*-hydroxyphenyl *n*-tridecyl ketone, m.p. 52-55° (corresp. 2,4-dinitrophenylhydrazone, m.p. 92.0-92.5°) and 36.7% yield (11) *p*-hydroxyphenyl *n*-tridecyl ketone, m.p. 78-80° (corresp. 2,4-dinitrophenylhydrazone, m.p. 142-143°); for prepn. of these same products by direct rearr. of phenyl myristate (above) with  $\text{AlCl}_3$  in *sym*-tetrachloroethane soln. see (19).]

With salts of organic acids. [ $\bar{C}$  with sodium myristate at 100° in absence of air gives (21) myristic anhydride (1:0629), m.p. 53.6° (22), 53.4° (23), 51° (21).]

With organometallic compounds. [ $\bar{C}$  with ethyl sodioacetoacetate gives (60% yield (13)) ethyl  $\alpha$ -myristoylacetoacetate, b.p. 170-183° at 3 mm.; this prod. with  $\text{NH}_3$  gas splits off the aceto group yielding (13) ethyl myristoylacetate, m.p. 36-37°, b.p. 187-188° at 7 mm.]

With organic amines.  $\bar{C}$  with organic primary amines yields the corresp. amides [e.g.,

$\bar{C}$  with *p*-cyimidine

anilide, m.p. 88-89

*N*-(vanillyl)myristamide,  $\alpha$ -form, m.p. 82°,  $\beta$ -form, m.p. 76.5-77°].

$\bar{C}$  on hydrolysis yields myristic acid (1:0630), m.p. 53.86°; for the amide, anilide, *p*-toluidide, and other derivatives corresp. to  $\bar{C}$  see myristic acid (1:0630).

(4) Ford-Moore, Phillips, *Rec. trav. chim.* 53, 857 (1934). (5) Rewadikar, Watson, *J. Indian Inst. Sci.* A-13, 125-140 (1939). (6) 1930, 11 3737; C.A. 25, 613 (1931). (6) Clark, Bell, *Trans. Roy. Soc. Can.* (3) 27, 111 97-103 (1933). (7) Kraft, Bürger, *Ber.* 17, 1378-1380 (1894). (8) Lues-David, Kuster, *Helv. Chim. Acta* 22, 59 (1939). (9) Ju, Shen, Wood, *J. Inst. Petroleum Tech.* 26, 514-520 (1940). (10) Averill, Roche, King, *J. Am. Chem. Soc.* 51, 868 (1929).

[ $\bar{C}$  with ethylene +  $AlCl_3$  gives a mixt. (87) of mono-, di-, tri-, and tetra-ethyl-*p*-dichlorobenzenes.]

[ $\bar{C}$  (3 moles) with  $CHCl_3$  (1 mole) +  $AlCl_3$  gives (14% yield (88)) *tris*-(2,5-dichlorophenyl)methane, colorless cryst. from  $C_6H_6$ , m.p. 206–208° (88). —  $\bar{C}$  with  $CCl_4$  +  $AlCl_3$  at room temp. (88) or in  $CS_2$  (89) (90) gives (26% yield (88)) 2,5,2',5'-tetrachlorobenzophenone dichloride, m.p. 173–174° (89) (88); this with dil. alc. on boilg. or htg. in s.t. at 130° hydrolyzes to 2,5,2',6'-tetrachlorobenzophenone, colorless cryst. from alc., m.p. 128° (89) (90). —  $\bar{C}$  with  $CCl_4$  +  $AlCl_3$  at 55° for 10 hrs. presumably first yields *tris*-(2,5-dichlorophenyl)methyl chloride (not isolated) which then loses 1 HCl giving (23% yield (88)) 1,4,7-trichloro-9-(2,5-dichlorophenyl)fluorene (?), m.p. 179–180° (88).]

[ $\bar{C}$  with acetyl chloride (3:7065) +  $AlCl_3$  gives (91) 2,5-dichloroacetophenone, b.p. 251° at 756 mm., m.p. 14° (91) (oxime, m.p. 130°, via Beckmann rearr. with conc.  $H_2SO_4$  gives acet-2,5-dichloroanilide, m.p. 133° (91)). —  $\bar{C}$  with benzoyl chloride (3:6240) +  $AlCl_3$  yields (91) (92) 2,5-dichlorobenzophenone, white ndls. from alc., m.p. 88° (91), 85–86° (92) (oxime, m.p. on slow htg. 207°, via Beckmann rearr. with conc.  $H_2SO_4$  gives benz-2,5-dichloroanilide, m.p. 122° (91)). —  $\bar{C}$  with *o*-chlorobenzoyl chloride (3:6640) +  $AlCl_3$  gives (92) 2,2',5-trichlorobenzophenone, m.p. 145–147° (92). —  $\bar{C}$  with 2,4-dichlorobenzoyl chloride +  $AlCl_3$  gives 2,5,2',4'-tetrachlorobenzophenone, m.p. 176° (92).] — [Note that  $\bar{C}$  fails to react with *sym*-dichlorodimethyl ether (3:5245).]

[ $\bar{C}$  with phthalic anhydride (1:0725) +  $AlCl_3$  gives (59.3% (94), 27% (93))  $\delta$ -(2,5-dichlorobenzoyl)benzoic acid, colorless pr. from  $C_6H_6$ , m.p. 169° cor. (93), 167° (94); this prod. on ring closure with fuming  $H_2SO_4$  (94) or conc.  $H_2SO_4$  (93) at 150° gives (yields: 83.5% (94), 83% (93)) 1,4-dichloroanthraquinone [Beil. VII-787, VII-(411)], or-yel. ndls. from AcOH, m.p. 187.5° cor. (93), 186° (94). — Note that  $\bar{C}$  reacts with phthalic anhydride +  $AlCl_3$  less readily than *o*-dichlorobenzene (3:6055) (use in sepa. of the two isomers (95)). — For corresp. condens. of  $\bar{C}$  with 3-sulphophthalic anhydride and 4-sulphophthalic anhydride in pres. of  $AlCl_3$  see (96).]

[ $\bar{C}$  on partial hydrol. with aq. MeOH alk., alk. carbonates, or best alk. earths in pres. of Cu or Cu salts at elevated temps. under press. gives in excellent yield (98) (99) (100) (101) (102) (103) (104) (105) *p*-chlorophenol (3:0475) (some phenol (1:1420) is also formed (102)); if the hydrolysis of  $\bar{C}$  is carried further (100) (106) hydroquinone (1:1690) is also obtd.] — [For study of kinetics of reactn. of  $\bar{C}$  with MeOH/alk. see (99) (107) (108).]

[ $\bar{C}$  with anhyd.  $NH_3$  in alc. in pres. of  $CuCl_2$  + Cu under press. at 150–200° yields (109) *p*-chloroaniline [Beil. XII-607, XII-(304)];  $\bar{C}$  with conc. aq.  $NH_4OH$  in pres. of CuO under press. at 150–200° gives (110) (111) (112) (113) (114) *p*-phenylenediamine [Beil. XIII-61, XIII-(18)]. — [ $\bar{C}$  with K diphenylamine at 240–245° gives (115) not only the expected *N,N,N',N'*-tetraphenyl-*p*-phenylenediamine, tbls. from acetone, m.p. 199–200°, but also by rearr. *N,N,N',N'*-tetraphenyl-*m*-phenylenediamine, m.p. 137.5–138°.]

[ $\bar{C}$  on mononitration, e.g., with 5 wt. pts. abs.  $HNO_3$  at 0° (116) (99), with 2 wt. pts.  $HNO_3$  ( $D = 1.48$ ) below 50° (120), or with 1.5 pts. of a mixt. contg. 2 pts.  $HNO_3$  ( $D = 1.54$ ) + 3 pts. conc.  $H_2SO_4$  (117) (118) (119) at 70–100° for 30–60 min., yields 1,4-dichloro-2-nitrobenzene [Beil. V-245, V-(131)], cryst. from alc., m.p. 55° (120), 54.5° (99), 54° (119), 53° (116) (note close proximity of this m.p. to that of the initial  $\bar{C}$ ).]

[ $\bar{C}$  on dinitration, e.g., with 4 wt. pts. fuming  $HNO_3$  ( $D = 1.62$ ) + 10 wt. pts. conc.  $H_2SO_4$  at b.p. for 5 hrs. (8) (121), or with 3 wt. pts.  $HNO_3$  ( $D = 1.52$ ) + 7.5 wt. pts. conc.  $H_2SO_4$  at b.p. for 2 hrs. (122), finally poured into aq., gives a mixt. contg. all three possible dinitro-*p*-dichlorobenzenes; of these the chief prod. is 1,4-dichloro-2,6-dinitrobenzene [Beil. V-265, V-(138)], m.p. 106° (123) (119), 105–106° (122), 105° (121), obtd. by recrystn if necessary) of the crude dinitration prod. from 30 r<sup>s</sup> (121); the contain the more soluble 1,4-dichloro-2,3-dinitro-

## 3:9912 n-HEXADECANOYL CHLORIDE

(Palmitoyl chloride)

Beil. II - 374

143° at	0.3 mm. (10)	
155-190° at	0.2 mm. (11)	

Note that care must be taken to avoid confusion of  $\bar{\text{C}}$  with palmityl chloride (1-chlorohexadecane) (3:0015).

PREPARATION OF  $\bar{\text{C}}$ 

[For prepn. of  $\bar{\text{C}}$  from palmitic acid (1:0650) with  $\text{PCl}_5$  (yields: 60% (2), 49% (12)) (5) (13) (14) (15) (16), with  $\text{PCl}_5 + \text{ZnCl}_2$  (72% yield (12)), with  $\text{SOCl}_2$  directly (yields: 93.5% (7), 80% (12), 80% (0)) (17) (19) (45) or in  $\text{CCl}_4$  soln. (18), or with phosgene (3:5000) at 140-155° (70-75% yield (20)) see indic. refs.)

CHEMICAL BEHAVIOR OF  $\bar{\text{C}}$ 

## BEHAVIOR WITH INORGANIC REACTANTS

With sodium. [ $\bar{\text{C}}$  (1 mole) with metallic sodium (1.2 moles) in dry ether refluxed with stirring as directed gives (79% yield (6)) dotriaconten-16-diol-16,17 dipalmitate, i.e., the dipalmitate ester of  $\text{C}_{11}\text{H}_2(\text{CH}_2)_{14}\text{C}(\text{OH})=\text{C}(\text{OH})(\text{CH}_2)_{14}\text{CH}_3$ , cryst. from acetone/ $\text{C}_6\text{H}_6$  (3:1), m.p. 61-62° (6).]

With sodium azide. [ $\bar{\text{C}}$  with  $\text{NaN}_3$  in  $\text{C}_6\text{H}_6$  gives (14) palmitoyl azide [Beil. II-375] (not isolated by (14)) which loses  $\text{N}_2$  with rearr. to pentadecyl isocyanate [Beil. IV-202] (not isolated by (14) but from indirect prepn. reported (21) as m.p. 8-14° [cf. corresp. behavior of lauroyl chloride (3:9858)].]

With water.  $\bar{\text{C}}$  with aq. hydrolyzes to palmitic acid (1:0650) +  $\text{HCl}$ . [For study of rate of hydrolysis with ord.  $\text{H}_2\text{O}$  and with  $\text{D}_2\text{O}$  see (22).]

## BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons. [ $\bar{\text{C}}$  with  $\text{C}_6\text{H}_6$  +  $\text{AlCl}_3$  gives (60% yield (23)) (21) (25) pentadecyl phenyl ketone (penmitophenone) [Beil. VII-347, VII<sub>1</sub>-(186)], lfts. from alc., m.p. 59° (23) (24) (26), b.p. 250.5-251.0° at 15 mm. (24) (corresp. oxime, m.p. 73-74° (26)). —  $\bar{\text{C}}$  with toluene +  $\text{AlCl}_3$  gives (24) pentadecyl p-tolyl ketone [Beil. VII-347, VII<sub>1</sub>-(186)], lfts. from alc., m.p. 60° (24) (26), b.p. 262° cor. at 15 mm. (24) (corresp. oxime, m.p. 60° (27), semicarbazone, m.p. 114.5° (26), phenylhydrazone, m.p. 54-55° (26)). — For analogous behavior of  $\bar{\text{C}}$  +  $\text{AlCl}_3$  + m-xylene (24), mesitylene (27) (2), diphenyl ether (28), and carbazole (28) see indic. refs.; for use of these products as waxes, addition agents for lubricants, etc., see (28) (29).]

With alcohols.  $\bar{C}$  with alcohols gives in general the corresp. alkyl palmitates [e.g.,  $\bar{C}$  with MeOH gives methyl palmitate (1:2055), m.p. 30°;  $\bar{C}$  with EtOH gives ethyl palmitate (1:2034),  $\alpha$ -form, m.p. 19.4°,  $\beta$ -form, m.p. 24.2°, etc.;  $\bar{C}$  with heptyl alc. (1:6480) gives (30) benzyl palmitate, m.p. 35°;  $\bar{C}$  with menthol (1:5940) gives (31) menthyl palmitate, m.p. 32°].

$\bar{C}$  (2 moles) with dihydric alcs. on htg. gives the corresp. neutral esters [e.g.,  $\bar{C}$  with ethylene glycol (1:6465) gives (32) ethylene glycol dipalmitate (1:2269), m.p. 70.5°;  $\bar{C}$  with propanediol-1,2 (1:6455) gives (32) propylene glycol dipalmitate, m.p. 52.5–54.5°;  $\bar{C}$  with butanediol-1,3 (1:6482) gives (32) 1,3-butylene glycol dipalmitate, m.p. 39–40°;  $\bar{C}$  with hutenediol-1,4 (1:6515) gives (32) tetramethylene glycol dipalmitate, m.p. 63°].

$\bar{C}$  has also been much employed in the prepn. of mixed glycerides, hut this topic cannot be expanded in detail in this text.

With phenols.  $\bar{C}$  on htg. with phenols splits out HCl yielding the corresp. esters. [E.g.,  $\bar{C}$  with phenol (1:1420) gives (5) phenyl palmitate, m.p. 45° (5), 44.5–46.0° (33), b.p. 249.5° at 15 mm. (5);  $\bar{C}$  with *p*-cresol (1:1410) gives (5) *p*-tolyl palmitate, m.p. 47°, b.p. 258° at 15 mm. —  $\bar{C}$  (2 moles) with pyrocatechol (1:1520) at 110° for 2 hrs gives (34) pyrocatechol dipalmitate, m.p. 58°;  $\bar{C}$  (2 moles) with resorcinol (1:1530) at 110° for 2 hrs. gives (34) resorcinol dipalmitate, m.p. 62.5–63.5°;  $\bar{C}$  (2 moles) with hydroquinone (1:1590) at 110° for 2 hrs. gives (34) hydroquinone dipalmitate, m.p. 94.5°].

[ $\bar{C}$  with phenol (1:1420) +  $AlCl_3$  in *sym*-tetrachloroethane (3:6750) as solvent, however, gives (35) (33) (36) a mixt. of the corresp. hydroxypalmitophenones; viz., 25.4% yield *o*-hydroxyphenyl pentadecyl ketone, m.p. 54–55° (corresp. 2,4-dinitrophenylhydrazone, m.p. 94–95° (35)), and 28.5% yield *p*-hydroxyphenyl pentadecyl ketone, m.p. 84.5–85° (35), 78° (37) (corresp. 2,4-dinitrophenylhydrazone, m.p. 141–142° (35)); for study of influence upon *o/p* ratio of use of nitrobenzene and of  $CS_2$  as solvents see (36).]

With salts of organic acids. [ $\bar{C}$  with Ag palmitate at 100° for 10 min. (38) or  $\bar{C}$  with  $Na\bar{A}$  (32) (42) gives palmitic anhydride (1:0651), m.p. 64° (39), 63.9° (40), 63–64° (41), 63° (38), 62–63° (32) (43), hut the latter is usually prepd. from palmitic acid (1:0650) by htg. with  $Ac_2O$  (39) (40) (41) (42) (43).]

With esters. [ $\bar{C}$  with diethyl sodiomalonate would be expected to give diethyl palmitoylmalonate, hut for unsuccessful attempt to realize this reaction see (44).]

[ $\bar{C}$  with ethyl sodio-acetoacetate in dry ether gives (62% yield (11)) (45) ethyl  $\alpha$ -palmitoylacetoacetate, m.p. 36–36.5° (11) (45); note that this prod. with aq. NaOH splits off the acetyl group giving (52% yield (11)) ethyl palmitoylacetae, m.p. 37–38° (11) (45).]

With amines.  $\bar{C}$  with org. prim. amines yields the corresp. amides [e.g.,  $\bar{C}$  with *p*-cymidine (2-methyl-5-isopropylaniline) gives (1) palmito-(2-methyl-5-isopropyl)anilide, m.p. 90–91°;  $\bar{C}$  with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (8) *N*-(vanillyl)-palmitamide,  $\alpha$ -form, m.p. 89–89.5°,  $\beta$ -form, m.p. 84–84.5°].

$\bar{C}$  on hydrolysis yields palmitic acid (1:0650), m.p. 62.7°; for the amide, anilide, *p*-toluidide, and other derivs. corresp. to  $\bar{C}$  see palmitic acid (1:0650).

Note that care must be taken to avoid confusion of  $\bar{C}$  with stearyl chloride (1-chlorooctadecane) (3:0035).

PREPARATION OF  $\bar{C}$

[For prepn. of  $\bar{C}$  from stearic acid (1:0660) with  $PCl_5$  directly (1) (12) (13) (21) or in  $CCl_4$  soln. (14), with  $SOCl_2$  directly (yields: 97% (10), 81% (3)) (4) (7) (15) (16) (17) or in  $CCl_4$  soln. (yield 80% (8)) (14), with  $PCl_5$  (15), with oxalyl (di)chloride (3:5060) (11), or with phosgene (3:5000) at 140-150° (70-75% yield (19)) see indic. refs.]

CHEMICAL BEHAVIOR OF  $\bar{C}$

BEHAVIOR WITH INORGANIC REAGENTS

Hydrogenation of  $\bar{C}$ . [ $\bar{C}$  with  $H_2$  +  $Pd/BaSO_4$  cat. in boilg. xylene gives (20) (21) stearaldehyde (1:0012).]  
Behavior with bromine. [For behavior of  $\bar{C}$  with  $Br_2$  at room temp., 100°, and 135° see (22).]  
Behavior with sodium. [ $\bar{C}$  (1 mole) with metallic sodium (1.2 moles) in dry ether under reflux gives (67% yield (3)) hexatriaconten-18-diol-18,10 distearate, i.e., the distearate ester of  $CH_3(CH_2)_{16}C(OH)=C(OH)(CH_2)_{16}CH_3$ , m.p. 67-68°.]  
With sodium azide. [ $\bar{C}$  with  $NaN_3$  in  $C_6H_6$  gives (23) (12) stearyl azide (not isolated) which loses  $N_2$  with rearr. giving (43% yield (23)) heptadecyl isocyanate, b.p. 206-209°

at 17 mm. {23}, 200-203° at 15 mm. {24}; cf. the corresp. behavior of lauroyl chloride (3:9858).]

With water.  $\bar{C}$  with aq. hydrolyzes to stearic acid (1:0660) + HCl.

#### BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons (or their equivalents). [ $\bar{C}$  with  $C_6H_6$  +  $AlCl_3$  gives (yields: 65% {25}, 60% {26}) {27} {18} heptadecyl phenyl ketone (stearophenone) (Beil. VII-347, VII-1-(187)), lfts. from alc., m.p. 64-65° {25}, 63.5-64.5° {18}, 64° {28}, 59° {27} {29} (corresp. oxime, m.p. 53° {27}, phenylhydrazone, m.p. 54° {28}); note that in this reaction no introduction of a second acyl radical occurs {30}, and that attempts to prepare stearophenone by use (with  $C_6H_6$  +  $AlCl_3$ ) of the mixed anhydride from stearic acid with ketene) gave very poor yields {29}. — For patents on the use of stearophenone as an electric insulator {31}, on its sulfonation {32}, or on its reaction with  $PCl_3$  {33} see indic. refs.]

[ $\bar{C}$  with toluene +  $AlCl_3$  gives {34} heptadecyl *p*-tolyl-ketone (Beil. VII-347, VII-1-(187)), lfts. from alc., m.p. 67° {34}, 66-67° {28}, b.p. 278° cor. at 15 mm. {34} (corresp. oxime, m.p. 64° {27}). — For analogous behavior of  $\bar{C}$  with naphthalene (1:7200) {18}, tetralin (1:7550) {18}, biphenyl (1:7175) {18} {35}, *p*-methylbiphenyl {35}, *p*-chlorobiphenyl (3:1912) {35}, diphenyl ether (1:7125) {35}, *p*-nitrodiphenyl ether {35}, furan (1:8015) {35}, 2-methylfuran {35}, dibenzofuran {35}, thiophene {35}, dibenzothiophene {35}, carbazole {35}, etc., see indic. refs.; for use of these products as waxes, addition agents for lubricants, etc., see {35} {36}.]

[For behavior of  $\bar{C}$  with resins derived from indene, coumarone, or dicyclopentadiene see {37}. — For addition of  $\bar{C}$  to alkynes in pres. of a condensing agent such as  $AlCl_3$ ,  $ZnCl_2$ , etc., see {38} cf. {39}.]

With alcohols.  $\bar{C}$  with alcohols gives in general the corresp. alkyl stearates. [E.g.,  $\bar{C}$  with MeOH gives methyl stearate (1:2095), m.p. 33.8°;  $\bar{C}$  with EtOH gives ethyl stearate (1:2078),  $\alpha$ -form, m.p. 30.0°,  $\beta$ -form, m.p. 33.5°. —  $\bar{C}$  with benzyl alc. (1:6480) gives {40} benzyl stearate, m.p. 45.8°;  $\bar{C}$  with menthol (1:5940) gives {41} menthyl stearate, m.p. 38-39°.]

$\bar{C}$  has also been much employed in the prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text.

With phenols. [ $\bar{C}$  on hgt. with phenols splits out HCl yielding the corresp. esters: e.g.,  $\bar{C}$  with phenol (1:1420) gives {1} phenyl stearate, m.p. 52° {1}, 61.5-53.0 {44}, b.p. 267° at 15 mm. {1};  $\bar{C}$  with *p*-cresol (1:1410) gives {1} *p*-tolyl stearate, m.p. 64°, b.p. 276° at 16 mm.]

[ $\bar{C}$  (2 moles) with pyrocatechol (1:1520) at 100° gives {42} {43} pyrocatechol distearate, m.p. 83-85° {43}, 68° {42};  $\bar{C}$  (2 moles) with hydroquinone (1:1590) at 130° gives {42} hydroquinone distearate, m.p. 97°.]

[ $\bar{C}$  with phenol (1:1420) +  $AlCl_3$  in *sym*-tetrachloroethane (3:6750) as solvent, however, gives {45} {44} {46} a mixt. of the corresp. hydroxystearophenones: viz., 27.8% yield *o*-hydroxyphenyl heptadecyl ketone, m.p. 64-66° (corresp. 2,4-dinitrophenylhydrazone, m.p. 96-97° {45}); and 28% yield *p*-hydroxyphenyl heptadecyl ketone, m.p. 87-89° corresp. 2,4-dinitrophenylhydrazone, m.p. 139.5-140° {45}); for study of influence upon *o/p* ratio of use of nitrobenzene or of  $CS_2$  as solvents see {46}.]

With salts of organic acids. [ $\bar{C}$  with Ag stearate at 100° for 10 min. gives {47} stearic nnhydride (1:4915), m.p. 71-72° {48}, 71-71.5° {49}, 70.7° {50}, 70.5° {47}, 70-71° {51}, but the latter is usually prepd. from stearic acid (1:0660) by hgt. with  $Ac_2O$  {48} {49} {50} {51}.]

With esters.  $\bar{C}$  with ethyl sodio-acetoacetate refluxed 1 hr. under  $N_2$  gives (68% yield (52)) ethyl  $\alpha$ -stearoylacetate, m.p. 42°; note that this prod. with aq. NaOH splits off its acetyl group giving (74% yield (52)) ethyl stearoylacetate, m.p. 46.5° (corresp. copper enolate, m.p. 111–112°).]

With Grignard reagents.  $\bar{C}$  with *ter*-BuMgBr gives (28.5% yield (8)) *ter*-butyl *n*-heptadecyl ketone, m.p. 44.8–45.1° (corresp. semicarbazone, m.p. 78.0–78.2°); note that low yield suggests probability that the RMgBr also acted as a reducing agent cf. corresp. behavior of lauroyl chloride (3:9858), but no study of such effect for this combination is reported. —  $\bar{C}$  with cyclohexyl MgBr gives (8) cyclohexyl *n*-heptadecyl ketone.]

$\bar{C}$  with EtMgBr + CdCl<sub>2</sub> (53) or  $\bar{C}$  with ZnEt<sub>2</sub> (54) gives (65% yield (53)) ethyl *n*-heptadecyl ketone (eikosanone-3) [Beil. I-719, I<sub>1</sub>-(374), I<sub>2</sub>-(774)], m.p. 60–61° (54), 59.5–60° (55), 57° (28), 54–55° (53) (corresp. oxime, m.p. 55.5–56.5° (54), semicarbazone, m.p. 89–91° (53))]

With diazomethane.  $\bar{C}$  with CH<sub>2</sub>N<sub>2</sub> (2.2 moles) as directed gives (88.5% yield (15)) 1-diazononadecanone-2, m.p. 69°, which in AcOH loses N<sub>2</sub> and esterifies giving (89% yield (15)) nonadecanone-2-yl-1 acetate, m.p. 72°.]

With amines.  $\bar{C}$  with org. prim. amines yields the corresp. amides [e.g.,  $\bar{C}$  with *p*-cymidine (2-methyl-5-isopropylaniline) gives (56) stearo-(2-methyl-5-isopropyl)anilide, m.p. 93–94°;  $\bar{C}$  with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (5) *N*-(vanillyl)-stearamide,  $\alpha$ -form, m.p. 94.5–95°,  $\beta$ -form, m.p. 90.0–90.5°].

$\bar{C}$  on hydrolysis yields stearic acid (1:0660), m.p. 69–70°; for the amide, anilide, *p*-toluidide, and other derivatives corresp. to  $\bar{C}$  see stearic acid (1:0660).

## CHAPTER XXIII

### I. INDEX OF COMPOUNDS ACCORDING TO EMPIRICAL FORMULA

This Empirical Formula Index comprises four parts as follows:

- A. Compounds containing only carbon and chlorine.
- B. Compounds containing only carbon, oxygen, and chlorine.
- C. Compounds containing only carbon, hydrogen, and chlorine.
- D. Compounds containing only carbon, hydrogen, oxygen, and chlorine.

Within each section the component individuals are arranged in groups according to increasing number of carbon atoms. Within each group of isomeric compounds the order of listing follows the sequence of the eight units comprising the Chemical Type Index.

#### A. COMPOUNDS CONTAINING ONLY CARBON AND CHLORINE

<b>C<sub>1</sub> GROUP</b>			<b>C<sub>4</sub> GROUP</b>

101° (121), and 1,4-dichloro-2,5-dinitrobenzene, m.p. 119° (122) (121) (124). — For f.p. compn. data and diagrams of mixtures of the 2,6- and 2,3-dinitro-*p*-dichlorobenzenes see (119), of mixtures of the 2,6- and 2,5-dinitro-*p*-dichlorobenzenes see (121). — Note also that the prod., m.p. 81°, formerly (8) supposed to be the 2,5-dinitro isomer, has since (121) been proved to be a compound of the 2,6- and 2,5-dinitro-1,4-dichlorobenzenes. — The relative proportion of the three dinitration products varies with conditions (119) (121) (122) (124).]

[ $\bar{C}$  on monosulfonation, e.g., with 1.5 wt. pts. fuming  $H_2SO_4$  (10–12%  $SO_3$ ) at 140–150° for 45 min. (118) cf. (27), gives on pouring into aq. (85–90% yield (118)) 1,4-dichlorobenzene-sulfonic acid-2, cryst. from aq. as monohydrate (for derivs. see below). — Note that  $\bar{C}$  is not sulfonated by conc.  $H_2SO_4$  even at 210° (16) (dif. from *o*-dichlorobenzene (3:6055) and use in sepn. from  $\bar{C}$ ); for removal of chlorobenzene (3:7903) from mixt. with dichlorobenzenes via sulfonation of former with 95%  $H_2SO_4$  see (17). — For use of reactn. prod. of  $\bar{C}$  with  $SO_2$  as dye intermed. or for mothproofing of wool see (125). — For reactn. of sodium *p*-dichlorobenzene-sulfonate with fused  $NaOH$  to yield hydroquinone (1:1590) see (126).]

[ $\bar{C}$  with 5 moles  $ClSO_3H$  at 150° for 1 hr. (127) (128) gives (85% yield (127) (128)) 1,4-dichlorobenzene-sulfonyl chloride-2, cryst. from lgr., m.p. 39° (127) (128), 38° (129), 36.8° (27) (corresp. amide, see below; corresp. sulfonanilide, m.p. 160° (128)); for use in prepn. of tetrachlorothioindigo see (130). —  $\bar{C}$  with 30 pts.  $ClSO_3H$  at 140° for 48 hrs. (128) gives both 1,4-dichlorobenzene-*bis*-(sulfonyl chloride)-2,6, m.p. 114° (corresp. *bis*-sulfonanilide, m.p. 215–217° dec (128)) and 1,4-dichlorobenzene-*bis*-(sulfonyl chloride)-2,5, m.p. 162° (corresp. *bis*-sulfonanilide, m.p. not given). — Note that  $\bar{C}$  reacts with  $ClSO_3H$  much less easily than *o*-dichlorobenzene; for use in sepn. of the two isomers via formn. of *o*-dichlorobenzene-sulfonyl chloride and sepn. from unchanged  $\bar{C}$  by distn. see (131).]

④ 1,4-Dichlorobenzene-sulfonamide-2 (2,5-dichlorobenzene-sulfonamide-1): cryst. from dil. alc., m.p. 179.5–180° u.c. (129), 181° (127), 185–186° (27) [From  $\bar{C}$  via treatment with  $ClSO_3H$  as directed (129) to 1,4-dichlorobenzene-sulfonyl chloride-2 (see above) and subsequent conv. with  $(NH_4)_2CO_3$  to desired sulfonamide] — [Note that, although the m.p. of this sulfonamide is practically identical with that from *m*-dichlorobenzene (3:5960), each depresses the m.p. of a mixt. with the other; the m.p.'s of the precursor sulfonyl chlorides, viz. 52–53° for the isomer from *m*-dichlorobenzene, 38° for that from  $\bar{C}$ , may also serve to distinguish them (129).] — [For similar prepn. and use of 1,4-dichlorobenzene-sulfonamide-2 see (132).]

## II. INDEX OF EMPIRICAL FORMULAS ACCORDING TO PERCENTAGE CHLORINE CONTENT

The empirical formulas for all groups of isomers listed in this book are represented below in diminishing order of their percentage chlorine. Note that there are numerous instances in which this value is the same for several different formulas. An analogous list of empirical formulas arranged according to their molecular weights comprises Index III (page 1383).

To ascertain which specific compounds corresponding to a given formula are described in the text of this volume, see the Empirical Formula Index (page 1359).

% Chlorine	Formula	% Chlorine	Formula	% Chlorine	Formula
92.2	$\text{CCl}_4$	76.9	$\text{C}_7\text{OCl}_4$	68.0	$\text{C}_7\text{OCl}_4$

### III. INDEX OF EMPIRICAL FORMULAS ACCORDING TO MOLECULAR WEIGHTS

The empirical formulas for all groups of isomers listed in this book are represented below in increasing order of their molecular weights. Note that there are numerous instances in which this value is the same for several different formulas. An analogous list of empirical formulas arranged according to their percentage chlorine comprises Index II (page 1380).

To ascertain which specific compounds corresponding to a given formula are described in the text of this volume see the Empirical Formula Index (page 1359).

M.W.	Formula	M.W.	Formula	M.W.	Formula

#### IV. INDEX OF COMPOUNDS ACCORDING TO CHEMICAL TYPES

The numerous individual compounds of Order III whose preparation, properties, and reactions comprise the main text of this book are there listed in progressively increasing order of melting points (Division A, Solids), boiling points (Division B, Liquids), or empirical formulas (Division C, liquids for which data at ordinary pressure are not available). Unlike the treatment of Order I in an earlier volume, the compounds of the present Order III are not subdivided into genera. For this reason a highly useful feature of this volume is the following Chemical Type Index in which each compound is listed in one (or more) of the following eight arbitrary units.

- |  |  |
|--|--|
| UNIT 1. Chloro substitution products of saturated acyclic hydrocarbons.  | UNIT 5. Chlorosubstitution products (and their relatives) of carbonyl compounds. |
| UNIT 2. Chloro substitution products of unsaturated acyclic hydrocarbons | UNIT 6. Chloro substitution products of carboxylic acids and anhydrides.         |
| UNIT 3. Chloro substitution products of cyclic hydrocarbons.             | UNIT 7. Acyl chlorides.  |
| UNIT 4. Chloro substitution products of hydroxy compounds.               | UNIT 8. Chlorine substitution products of ethers and of esters.                  |

In order to facilitate recognition of the extent of subdivision of the above eight *units*, a brief summary of the subclassification is placed at the head of each one. Note that the names employed in this index are those best suited to recognition of the chemical relationships involved, and are not necessarily the same as those selected as principal names in the individual descriptions in the text.

Attention is also called to the fact that, in addition to this chemical type index, this volume is provided with conventional alphabetical name index and with empirical formula index.

##### UNIT 1. CHLORO SUBSTITUTION PRODUCTS OF ACYCLIC SATURATED HYDROCARBONS

*(Summary of Classification of Unit 1)*

###### A. MONOCHLORO DERIVATIVES.

1. With primary halogen.
2. With secondary halogen.
3. With tertiary halogen.

## B. DICHLORO DERIVATIVES.

1. *With both chlorine atoms primary.*
2.
  - a. Both chlorine atoms on same carbon.
  - b. Both chlorine atoms on different carbons.
3. *With both chlorine atoms tertiary.*
- 4.
- 5.
- 6.

## C. TRICHLORO DERIVATIVES.

- 1.
- 2.
- 3.
- 4.
- 5.
- 6.
- 7.

## D. TETRACHLORO DERIVATIVES.

1. *With all four chlorine atoms primary.*
- 2.
- 3.
- 4.
- 5.
6. *With two chlorine atoms primary, one secondary, and one tertiary.*

## E. PENTACHLORO DERIVATIVES.

1. *With all five chlorine atoms primary*
2. *With four chlorine atoms primary and one secondary*
3. *With three chlorine atoms primary and two secondary.*
4. *With two chlorine atoms primary and three secondary*
5. *With four chlorine atoms primary and one tertiary*

## F. HEXACHLORO DERIVATIVES

1. *With all six chlorine atoms primary*
2. *With five chlorine atoms primary and one secondary.*
3. *With four chlorine atoms primary and two secondary.*

## G. HEPTACHLORO DERIVATIVES.

## H. OCTACHLORO DERIVATIVES.

XII-630, XII<sub>1</sub>-(313)] via diazotization (9) (6) and reaction with alc. (9), or by reduction to 3,4,5-trichlorophenylhydrazine and reaction of this with Fehling soln. (poor yield (6)) (5), see indie. refs.; for prepn. of  $\bar{C}$  from 2,3-dichloroaniline [Beil. XII-621] (7) or from 2,6-dichloroaniline [Beil. XII-626] (7) (4) via diazotization and use of  $Cu_2Cl_2$  reaction see indie. refs.; for prepn. of  $\bar{C}$  from 4-chloro-3,5-diaminobenzenesulfonic acid-1 [Beil. XIV-718, XIV<sub>1</sub>-(727)] via conv. to 3,4,5-trichlorobenzenesulfonic acid-1 and subsequently hydrolyzing the sulfonic acid group see (1).]

[For formn. of  $\bar{C}$  (together with other prod.) from n mixt. of *o*- and *p*-dichlorobenzenes with  $Cl_2$  (10), or from *m*-dichlorobenzene +  $AlCl_3$  +  $Cl_2$  (11), or from  $\alpha$ -,  $\beta$ -, or  $\gamma$ -benzenehexachlorides with alc. KOH (5), or from  $\alpha$ -benzenehexachloride with pyridine or quinoline (5), see indie. refs.]

[ $\bar{C}$  with  $Cl_2$  in pres. of  $Al/Hg$  yields (9) exclusively 1,2,3,4-tetrachlorobenzene (3:0655), m.p. 44-45° (9);  $\bar{C}$  with liq.  $Cl_2$  in s.t. at room temp. for 7 days adds 6 atoms halogen yielding (12) 1,1',2,2',3,3',4,5,6-octachlorocyclohexane (1,2,3-trichlorobenzene hexachloride), pr. from MeOH, m.p. 80° (12).]

[ $\bar{C}$  on hydrolysis with steam at 550-800° over cat. yields (13) pyrogallol (1:1555); for behavior of  $\bar{C}$  with NaOMe in MeOH see (6) (14).]

$\bar{C}$  on mononitration, e.g., by soln. of  $\bar{C}$  (1 g.) in 5 ml. fuming  $HNO_3$  ( $D = 1.49$ ) (17), gives 100% yield (17) 1,2,3-trichloro-4-nitrobenzene [Beil. V-246], long colorless ndls. from alc., m.p. 56° (15) (7), 55-56° (17) (3) (note that the isomeric 1,2,3-trichloro-5-nitrobenzene [Beil. V-247, V<sub>1</sub>-(131)] has m.p. 72°).

$\bar{C}$  on dinitration, e.g.,  $\bar{C}$  (1 g.) refluxed 1 hr. with 5 ml. fuming  $HNO_3$  ( $D = 1.49$ ) + 5 ml. conc.  $H_2SO_4$ , then poured into aq. (17) (16), gives 100% yield 1,2,3-trichloro-4,6-dinitrobenzene, ndls. from hot alc., m.p. 92-93° (16) (17); this prod. (1 g.) htd. 1 hr. at 100° with 5 g. aniline as directed (17) yields 1,3-dianilino-2-chloro-4,6-dinitrobenzene, cryst. from  $C_6H_6$  or alc., m.p. 136-138° (17). [Note that an isomeric 1,2,3-trichloro-4,5-dinitrobenzene, cryst. from alc., m.p. 105-106° (16), has been obtd. by further nitration of 1,2,3-trichloro-5-nitrobenzene (mentioned in preceding paragraph).]

$\bar{C}$  with chlorosulfonic acid as directed (17) gives 1,2,3-trichlorobenzenesulfonyl chloride-4, m.p. 64-65° u.c. (17), 65-66° (2); this prod. with  $(NH_4)_2CO_3$  readily yields (17) 1,2,3-trichlorobenzenesulfonamide-4, m.p. 226-230° dec. u.c. (17).

## B. Dichloro Derivatives

## 1. With both chlorine atoms primary

## a. Both chlorine atoms on same carbon

$CH_2Cl_2$	Methylene dichloride .	3:5020
$C_2H_4Cl_2$	1,1-Dichloroethane...	3:5035
$C_3H_6Cl_2$	1,1-Dichloropropane..	3:7230
$C_4H_8Cl_2$	1,1-Dichlorobutane ..	3:7550
	1,1-Dichloro-2-methyl- propane . . . . .	3:7425
$C_5H_{10}Cl_2$	1,1-Dichloropentane..	3:8015
	4,4-Dichloro-2-methyl- butane ....	3:7885
$C_7H_{14}Cl_2$	1,1-Dichloroheptane..	3:8650

## b. The two chlorine atoms on different carbons

$C_2H_4Cl_2$	1,2-Dichloroethane...	3:5130
$C_3H_6Cl_2$	1,3-Dichloropropane..	3:5450
$C_4H_8Cl_2$	1,4-Dichlorobutane	3:5835
	1,3-Dichloro-2-methyl- propane .. . . .	3:7960
$C_5H_{10}Cl_2$	1,5-Dichloropentane..	3:8575
	1,4-Dichloro-2-methyl- butane .....	3:8360
$C_6H_{12}Cl_2$	1,6-Dichlorohexane...	3:8720
$C_7H_{14}Cl_2$	1,7-Dichloroheptane..	3:9422
	1,5-Dichloro-3,3- dimethylpentane...	3:9430
$C_8H_{16}Cl_2$	1,8-Dichlorooctane...	3:8805
$C_9H_{18}Cl_2$	1,9-Dichlorononane...	3:8880
$C_{10}H_{20}Cl_2$	1,10-Dichlorodecane..	3:0720

## 2. With both chlorine atoms secondary

## a. Both chlorine atoms on same carbon

$C_3H_5Cl_2$  2,2-Dichloropropane... 3:7140

$C_4H_9Cl_2$  2,2-Dichlorobutane... 3:7415

$C_5H_{11}Cl_2$  2,2-Dichloropentane... 3:7755

3,3-Dichloropentane... 3:7895

3,3-Dichloro-2-methylbutane..... 3:9230

$C_6H_{13}Cl_2$  2,2-Dichlorohexane... 3:9342

3,3-Dichloro-2,2-dimethylbutane... 3:4325

4,4-Dichloro-2,2-dimethylbutane... 3:8132

$C_7H_{15}Cl_2$  2,2-Dichloroheptane... 3:9424

4,4-Dichloroheptane... 3:9426

3,3-Dichloro-2,4-dimethylpentane..... 3:7610

$C_8H_{17}Cl_2$  2,2-Dichlorooctane... 3:8670

3,3-Dichloro-2,2,4-trimethylpentane... 3:9530

## b. Both chlorine atoms on different carbons

$C_4H_9Cl_2$  *d,l*-2,3-Dichlorobutane... 3:7615

*meso*-2,3-Dichlorobutane... 3:7680

$C_5H_{11}Cl_2$  2,3-Dichloropentane... 3:8010

2,4-Dichloropentane... 3:8120

$C_6H_{13}Cl_2$  2,3-Dichlorohexane... 3:8300

2,5-Dichlorohexane... 3:8525

3,4-Dichlorohexane... 3:9344

## 3. With both chlorine atoms tertiary

$C_4H_9Cl_2$  2,3-Dichloro-2,3-dimethylbutane... 3:4520

$C_7H_{15}Cl_2$  2,4-Dichloro-2,4-dimethylpentane... 3:9128

$C_8H_{17}Cl_2$  2,5-Dichloro-2,5-dimethylhexane... 3:1550

3,4-Dichloro-3,4-dimethylhexane... 3:8315

$C_9H_{19}Cl_2$  2,6-Dichloro-2,6-dimethylheptane... 3:0455

$C_{10}H_{21}Cl_2$  2,7-Dichloro-2,7-dimethyloctane... 3:0840

3,4-Dichloro-3,4-dimethylhexane... 3:9724

## 4. With one chlorine primary and one secondary

$C_3H_7Cl_2$  1,2-Dichloropropane... 3:5200

$C_4H_9Cl_2$  1,2-Dichlorobutane... 3:7680

1,3-Dichlorobutane... 3:7925

$C_5H_{11}Cl_2$  1,2-Dichloropentane... 3:8140

1,3-Dichloropentane... 3:9220

1,4-Dichloropentane... 3:9224

1,3-Dichloro-2-methylbutane... 3:9228

3,4-Dichloro-2-methylbutane..... 3:8075

$C_6H_{13}Cl_2$  1,2-Dichlorohexane... 3:8380

1,5-Dichlorohexane... 3:9340

$C_7H_{15}Cl_2$  1,2-Dichloroheptane... 3:9420

1,2-Dichloro-4,4-dimethylpentane... 3:8516

$C_8H_{17}Cl_2$  1,6-Dichlorooctane... 3:9530

1,7-Dichlorooctane... 3:9532

4-Chloro-3-(chloromethyl)heptane... 3:9534

$C_9H_{19}Cl_2$  1,2-Dichlorononane... 3:9632

## 5. With one chlorine primary and one tertiary

$C_4H_9Cl_2$  1,2-Dichloro-2-methylpropane.... 3:7430

$C_5H_{11}Cl_2$  1,2-Dichloro-2-methylbutane..... 3:7920

2,4-Dichloro-2-methylbutane..... 3:8105

$C_6H_{13}Cl_2$  2,5-Dichloro-2-methylpentane..... 3:8540

## 6. With one chlorine secondary and one tertiary

$C_5H_{11}Cl_2$  2,3-Dichloro-2-methylbutane..... 3:7975

$C_6H_{13}Cl_2$  2,3-Dichloro-2-methylpentane..... 3:9346

## C. Trichloro Derivatives

## 1. With all three chlorine atoms primary

$CHCl_3$  Chloroform..... 3:5050

$C_2H_5Cl_3$  1,1,1-Trichloroethane.. 3:5085  
1,1,2-Trichloroethane. 3:5330

$C_3H_5Cl_3$  1,1,1-Trichloropropane 3:5270  
1,1,3-Trichloropropane 3:5660

$C_4H_9Cl_3$  4,4,4-Trichloro-2-methylbutane .... 3:9216

2. With two chlorine atoms primary and one secondary

$C_3H_5Cl_3$  1,1,2-Trichloropropane 3:5630  
1,2,3-Trichloropropane 3:5840

$C_4H_7Cl_3$  1,1,3-Trichlorobutane. 3:9086

$C_4H_9Cl_3$  1,3-Dichloro-2-(chloromethyl)butane .... 3:9218

3. With two chlorine atoms primary and one tertiary

$C_4H_7Cl_3$  1,1,2-Trichloro-2-methylpropane .... 3:5710  
1,2,3-Trichloro-2-methylpropane..... 3:5885

4. With one chlorine atom primary and two secondary

$C_3H_5Cl_3$  1,2,2-Trichloropropane 3:5475

$C_4H_7Cl_3$  1,2,3-Trichlorobutane 3:5935

5. With one chlorine each primary, secondary, and tertiary

$C_3H_5Cl_3$  1,2,3-Trichloro-2-methylbutane . . 3:6100

6. With all three chlorine atoms secondary

$C_4H_7Cl_3$  2,2,3-Trichlorobutane. 3:5680

7. With two chlorine atoms secondary and one tertiary

$C_4H_9Cl_3$  2,3,3-Trichloro-2-methylbutane . 3:4755

D. Tetrachloro Derivatives

1. With all four chlorine atoms primary

$CCl_4$  Carbon tetrachloride . 3:5100

$C_2H_2Cl_4$  1,1,1,2-Tetrachloroethane ... 3:5535

1,1,2,2-Tetrachloroethane... 3:5750

$C_3H_3Cl_4$  1,1,3-Trichloro-2-(chloromethyl)propane . .... 3:9084

$C_4H_5Cl_4$  1,3-Dichloro-2,2-bis-(chloromethyl)propane ..... 3:2657

2. With three chlorine atoms primary and one secondary

$C_2H_4Cl_4$  1,1,1,2-Tetrachloropropane. .... 3:5785

1,1,2,3-Tetrachloropropane ..... 3:6035

$C_4H_8Cl_4$  1,1,1,2-Tetrachlorobutane... 3:5622

3. With two chlorine atoms primary and two secondary

$C_3H_4Cl_4$  1,1,2,2-Tetrachloropropane ..... 3:5825

1,2,2,3-Tetrachloropropane .. ... 3:5895

$C_4H_8Cl_4$  1,2,3,4-Tetrachlorobutane (solid isomer) ..... 3:1760  
(liquid isomer)..... 3:9082

$C_6H_{10}Cl_4$  1,1,2,2-Tetrachlorohexane ..... 3:9332

4. With one chlorine atom primary and three secondary

$C_4H_8Cl_4$  1,2,2,3-Tetrachlorobutane . . . 3:0078

1,2,3,3-Tetrachlorobutane .. ... 3:9080

5. With three chlorine atoms primary and one tertiary

$C_4H_8Cl_4$  1,1,1,2-Tetrachloro-2-methylpropane 3:4725

1,1,2,3-Tetrachloro-2-methylpropane .. 3:6165

1,2,3-Trichloro-2-(chloromethyl)propane ... . 3:6335

6. With two chlorine atoms primary, one secondary, and one tertiary

$C_4H_8Cl_4$  1,2,3-Trichloro-2-(chloromethyl)butane . . . . 3:5230

E. Pentachloro Derivatives

1. With all five chlorine atoms primary

$C_2HCl_5$  Pentachloroethane.. 3:5880

2. With four chlorine atoms primary and one secondary

$C_4H_3Cl_5$  1,1,1,2,3-Pentachloropropane .. . 3:4740

1,1,2,3,3-Pentachloropropane... 3:6280

$C_6H_{11}Cl$	2-Chlorohexene-1 . . . .	3:7530
	3-Chlorohexene-3 . . . .	3:7535
	2-Chloro-3,3-dimethyl- butene-1 . . . . .	3:7340
$C_7H_{13}Cl$	2-Chloroheptene-1 . . . .	3:7938
	4-Chloroheptene-3 . . . .	3:8023
	3-Chloro-2,4-dimethyl- pentene-2 . . . . .	3:7605
$C_8H_{15}Cl$	2-Chlorooctene-1 . . . .	3:8346
	2-Chlorooctene-2 . . . .	3:8345
	4-Chlorooctene-4 . . . .	3:8230

2-Chloro-3-ethyl-3-  
methylpentene-1 . . . .

$C_{10}H_{19}Cl$	5-Chlorodecene-5 . . . .	3:9712
------------------	--------------------------	--------

$b_2$  DICHLORO

$C_3H_4Cl_2$	2,3-Dichloropropene-1	3:5190
$C_4H_6Cl_2$	2,3-Dichlorobutene-1 .	3:9074
	1,2-Dichlorobutene-2 (h-b) . . . . .	3:5615
	1,2-Dichlorobutene-2 (l-h) . . . . .	3:5360
	1,3-Dichlorobutene-2 .	3:5550

$C_5H_8Cl_2$	2,5-Dichloropentene-2	3:9202
	3,4-Dichloropentene-2	3:8045
	1,3-Dichloro-2-methyl- butene-2 . . . . .	3:8170

$b_2$  POLYCHLORO

$C_4H_6Cl_3$	1,2,4-Trichloro- butene-2 . . . . .	3:9062
	2,3,4-Trichloro- butene-2 . . . . .	3:9064
$C_4H_4Cl_4$	2,3,3,4-Tetrachloro- butene-1 . . . . .	3:9060

2. With two chlorine atoms on C attached  
to unsaturation

a. Both these chlorines are on same  
C atom

$C_2H_2Cl_2$	1,1-Dichloroethylene..	3:5005
$C_3H_4Cl_2$	1,1-Dichloropropene-1	3:5120
$C_4H_6Cl_2$	1,1-Dichloro-2-methyl- propene-1 . . . . .	3:5300
$C_2HCl_3$	1,1,2-Trichloro- ethylene . . . . .	3:5170

$C_3H_3Cl_3$	1,1,2-Trichloro- propene-1 . . . . .	3:5395
--------------	---	--------

$C_4H_5Cl_3$	1,1,3-Trichloro-2- methylpropene-1 . . . .	3:5025
--------------	---	--------

$C_6H_9Cl_3$	1,1,2-Trichloro- hexene-1 . . . . .	3:8326
--------------	--	--------

$C_2Cl_4$	Tetrachloroethylene . .	3:5460
-----------	-------------------------	--------

$C_5HCl_5$	1,1,2,3,3-Pentachloro- propene-1 . . . . .	3:6075
------------	---	--------

$C_3Cl_6$	Hexachloropropene . . .	3:6370
-----------	-------------------------	--------

These two chlorines are on differ-  
ent carbons

$C_2H_2Cl_2$	<i>cis</i> -1,2-Dichloro- ethylene . . . . .	3:5042
	<i>trans</i> -1,2-Dichloro- ethylene . . . . .	3:5028

$C_3H_4Cl_2$	1,2-Dichloropro- pene-1 (h-b. isomer)	3:5150
	1,2-Dichloropropene-1 (l-b. isomer) . . . . .	3:5110

	<i>cis</i> -2,3-Dichloro- butene-2 . . . . .	3:5500
	<i>trans</i> -2,3-Dichloro- butene-2 . . . . .	3:7395

$C_6H_{10}Cl_2$	1,2-Dichlorohexene-1 .	3:9330
-----------------	------------------------	--------

$C_4HCl_3$	1,1,2-Trichloro- ethylene . . . . .	3:5170
------------	--	--------

$C_3H_3Cl_3$	1,1,2-Trichloropro- pene-1 . . . . .	3:5395
	1,2,3-Trichloropro- pene-1 . . . . .	3:5050

$C_3H_2Cl_4$	1,2,3,3-Tetrachloro- propene-1 . . . . .	3:5920
--------------	---	--------

$C_4Cl_4$	Tetrachloroethylene . .	3:5460
-----------	-------------------------	--------

$C_6H_2Cl_4$	1,1,2,3,4,4-Hexa- chlorobutene-2 (liquid isomer) . . . . .	3:9046
	(solid isomer) . . . . .	3:1945

$C_6H_2Cl_6$	1,2,3,4,5,6-Hexa- chlorohexene-3 . . . . .	3:1220
--------------	---	--------

c. Polychloro			$C_6H_4Cl_2$	1-Chloro-2-(chloromethyl)-butadiene-1,3.....	3:9195
$C_4H_2Cl_3$	3,3,3-Trichloropropene-1.....	3:5345			
$C_4H_4Cl_2$	3,3,3-Trichloro-2-methylpropene-1...	3:5605	c. $C_8$ series		
$C_4H_5Cl_2$	1,1,1,4,4-Pentachlorobutene-2.....	3:9054	$C_8H_8Cl$	3-Chlorohexadiene-1,3	3:9312

$C_{10}H_{19}Cl$  3-Chloro-3-methylnonyne-4. .... 3:9710

b. Dichloro

$C_8H_{13}Cl_2$  2,5-Dichloro-2,5-dimethylhexene-3.. 3:9504

F. Of Alkadi-yne

$C_4Cl_2$  1,4-Dichlorobutyne-1,3..... 3:9040

G. Of Alkenynes

$C_4H_5Cl$  1-Chlorobuten-3-yne-1 .. . . . . 3:7070

$C_7H_9Cl$  5-Chloro-5-methylhexen-1-yne-3 .. 3:9402

**UNIT 3. CHLORO SUBSTITUTION PRODUCTS OF HYDROCARBONS CONTAINING CYCLIC NUCLEI**

(Summary of Classification of Unit 3)

A. OF CYCLOALKANES.

B. OF MONONUCLEAR AROMATIC HYDROCARBONS.

1. With all chlorine in nucleus.
2. With all chlorine in side chain(s).
  - a. Saturated side chain(s).
  - b. Unsaturated side chain(s).
3. With chlorine both in ring and in side chain(s).

C. OF POLYNUCLEAR AROMATIC HYDROCARBONS.

1. With all chlorine in nucleus.
  - a. Systems with uncondensed rings.
  - b. Systems with condensed rings.
2. With all chlorine in side chain(s).
  - a. Systems with two uncondensed rings.
  - b. Systems with two condensed rings.
  - c. Systems with three uncondensed rings.
3. With chlorine both in nucleus and side chain.

**UNIT 3. CHLORO SUBSTITUTION PRODUCTS OF HYDROCARBONS CONTAINING CYCLIC NUCLEI**

A. Of Cycloalkanes

$C_5H_9Cl$  Chlorocyclopentane... 3:7545

$C_6H_{11}Cl$  Chlorocyclohexane.... 3:8040

$C_6H_9Cl_2$  *cis*-1,2,3,4,5,6-Hexachlorocyclohexane.. 3:4410

*trans*-1,2,3,4,5,6-Hexachlorocyclohexane.. 3:4990

B. Of Mononuclear Aromatic Hydrocarbons

1. With all chlorine in nucleus

$C_6H_5Cl$  Chlorobenzene..... 3:7903

$C_6H_4Cl_2$  *o*-Dichlorobenzene ... 3:6055

*m*-Dichlorobenzene ... 3:5960

*p*-Dichlorobenzene.... 3:0990

$C_6H_3Cl_3$	1,2,3-Trichlorobenzene	3:0990	$C_9H_{11}Cl$	2-Chloro-1,3,5-trimethylbenzene, . . .	3:8725

3:0993 1,1-Di-(*p*-CHLOROPHENYL)ETHANE $C_{14}H_{12}Cl_2$ 

Beil. S.N. 470

M.P. 51-55° (1)      B.P. 143-145° at 2 mm. (1)

Colorless cryst. from 90% AcOH. — Note that, when pure, neither solid  $\bar{C}$  nor its solns. show any fluorescence either in visible or ultraviolet light. (1). — Note also that, although m.p. of  $\bar{C}$  is identical with that of its next lower homolog, viz., di-(*p*-chlorophenyl)methane (4,4'-dichlorodiphenylmethane) (3:1057), nevertheless the m.p. of their mixture is depressed to 40-50° (1).

[For prepn. of  $\bar{C}$  from 1,1-di-(*p*-chlorophenyl)ethylene (3:2475) by cat. hydrogenation (62% yield) see (1); for formn. of  $\bar{C}$  from chlorobenzene (3:7903) with acetylene in presence of  $AlCl_3$  see (2), but note that by this method various undetermined impurities which show blue fluorescence are also formed (1).]

$\bar{C}$  on oxidn. with  $CrO_2/AcOH$  + trace of  $H_2SO_4$  gives (1) 4,4'-dichlorobenzophenone (3:4270), m.p. 112-113°.

$\bar{C}$  does not (1) yield an addn. prod. with  $PhOH$ .

## UNIT 4. CHLORO SUBSTITUTION PRODUCTS OF HYDROXY COMPOUNDS

(Summary of Classification of Unit 4)

## A. OF ALCOHOLS

## 1. Of acyclic alcohols.

## a. Saturated monohydric.

a<sub>1</sub> Primary.a<sub>2</sub> Secondary.a<sub>3</sub> Tertiary.

## b. Saturated dihydric.

## c. Unsaturated (olefinic) monohydric.

c<sub>1</sub> Primary.c<sub>2</sub> Secondary.

## 2. Of cyclanols (alicyclic alcohols).

## 3. Of aromatic alcohols.

## 4. Of alcohols containing also other functional groups.

a. Ether/alcohols.

b. Ester/alcohols.

c. Ether/ester/alcohols.

d. Acid/alcohols (hydroxy acids).

## B. OF PHENOLS.

## 1. Of mononuclear phenols.

## a. Monohydric.

a<sub>1</sub> Derivatives of phenol.a<sub>2</sub> Derivatives of methylphenols.a<sub>3</sub> Derivatives of xylenols.a<sub>4</sub> Derivatives of miscellaneous alkylphenols.a<sub>5</sub> Derivatives of phenolic aldehydes.a<sub>6</sub> Derivatives of phenolic acids.a<sub>7</sub> Derivatives of phenolic acid chlorides.

## b. Dihydric.

b<sub>1</sub> Derivatives of pyrocatechol.b<sub>2</sub> Derivatives of resorcinol.b<sub>3</sub> Derivatives of hydroquinone.

## c. Trihydric.

## 2. Of binuclear phenols.

## a. Monohydric.

a<sub>1</sub> With uncondensed rings.a<sub>2</sub> With condensed rings.

# UNIT 5. CHLORO SUBSTITUTION PRODUCTS OF CARBONYL COMPOUNDS (AND THEIR RELATIVES)

(Summary of Classification of Unit 5)

## A. OF ALDEHYDES.

1. *Acyclic aldehydes.*

a. Saturated.

b. Unsaturated.

c. Relatives of the above.

c<sub>1</sub> Hydrates.c<sub>2</sub> Hemiacetals.c<sub>3</sub> Diethylacetals.c<sub>4</sub> Acetals with chlorine only in alcohol radicals;c<sub>5</sub> Polymers.2. *Aromatic aldehydes.*

a. Simple aldehydes.

b. Phenolic aldehydes.

## B. OF KETONES.

1. *Dialkyl ketones.*2. *Alcyclic ketones.*3. *Alkyl aryl ketones.*

a. With chlorine only in alkyl.

b. With chlorine both in alkyl and aryl.

c. With chlorine only in aryl.

4. *Diaryl ketones.*5. *Ketones containing also other functional groups.*

a. Keto-acid chlorides.

b. Keto-acid esters.

## C. OF QUINONES.

1. *Mononuclear quinones.*2. *Dinuclear quinones.*3. *Trinuclear quinones.*

# UNIT 5. CHLORO SUBSTITUTION PRODUCTS OF CARBONYL COMPOUNDS (AND THEIR RELATIVES)

## A. Of Aldehydes

1. *Acyclic Aldehydes*

a. Saturated

a<sub>7</sub> PHENOLIC ACID CHLORIDES

$C_7H_5O_2Cl$	2-Hydroxybenzoyl chloride . . . . .	3:0085
	3-Hydroxybenzoyl chloride . . . . .	3:9446
	4-Hydroxybenzoyl chloride . . . . .	3:9447

## b. Dihydric

b<sub>1</sub> DERIVATIVES OF PYROCATECHOL

$C_6H_4O_2Cl$	3-Chlorocatechol . . . . .	3:0745
	4-Chlorocatechol . . . . .	3:2470
$C_6H_4O_2Cl_2$	3,5-Dichlorocatechol . . . . .	3:2192
	4,5-Dichlorocatechol . . . . .	3:3525
$C_6H_3O_2Cl_3$	3,4,5-Trichlorocatechol . . . . .	3:3448
$C_6H_2O_2Cl_4$	Tetrachlorocatechol . . . . .	3:4875

b<sub>2</sub> DERIVATIVES OF RESORCINOL

$C_6H_4O_2Cl$	2-Chlororesorcinol . . . . .	3:2690
	4-Chlororesorcinol . . . . .	3:3100
	5-Chlororesorcinol . . . . .	3:3530
$C_6H_4O_2Cl_2$	4,6-Dichlororesorcinol . . . . .	3:3390
$C_6H_3O_2Cl_3$	2,4,6-Trichlororesorcinol . . . . .	3:2174
$C_6H_2O_2Cl_4$	Tetrachlororesorcinol . . . . .	3:4135

b<sub>3</sub> DERIVATIVES OF HYDROQUINONE

$C_6H_4O_2Cl$	2-Chlorohydroquinone . . . . .	3:3130
$C_6H_4O_2Cl_2$	2,3-Dichlorohydroquinone . . . . .	3:4220
	2,5-Dichlorohydroquinone . . . . .	3:4690
	2,6-Dichlorohydroquinone . . . . .	3:4600
$C_6H_3O_2Cl_3$	2,3,5-Trichlorohydroquinone . . . . .	3:4052
$C_6H_2O_2Cl_4$	Tetrachlorohydroquinone . . . . .	3:4941
$C_6H_2O_4Cl_2$	2,5-Dichloro-3,6-dihydroxybenzoquinone-1,4 . . . . .	3:4970

## c. Trihydric

$C_6H_3O_3Cl_3$	4,5,6-Trichloropyrogallol . . . . .	3:4782
-----------------	-------------------------------------	--------

$C_6H_3O_4Cl_3$	3,5,6-Trichloro-2-hydroxyhydroquinone . . . . .	3:4444
Contd.	2,4,6-Trichlorophloroglucinol . . . . .	3:4030

## 2. Of binuclear phenols

## a. Monohydric

a<sub>1</sub> WITH UNCONDENSED RINGS

$C_{12}H_9OCl$	3-Chloro-2-hydroxybiphenyl . . . . .	3:1757
	5-Chloro-2-hydroxybiphenyl . . . . .	3:8980
	3-Chloro-4-hydroxybiphenyl . . . . .	3:1900
	4'-Chloro-4-hydroxybiphenyl . . . . .	3:4262

a<sub>2</sub> WITH CONDENSED RINGS

$C_{10}H_7OCl$	2-Chloronaphthol-1 . . . . .	3:1490
	3-Chloronaphthol-1 . . . . .	3:4170
	4-Chloronaphthol-1 . . . . .	3:3720
	5-Chloronaphthol-1 . . . . .	3:3960
	6-Chloronaphthol-1 . . . . .	3:2515
	7-Chloronaphthol-1 . . . . .	3:3810
	8-Chloronaphthol-1 . . . . .	3:1610
$C_{10}H_6OCl_2$	2,3-Dichloronaphthol-1 . . . . .	3:2935
	2,4-Dichloronaphthol-1 . . . . .	3:3250
	5,7-Dichloronaphthol-1 . . . . .	3:3985
	5,8-Dichloronaphthol-1 . . . . .	3:3420
	6,7-Dichloronaphthol-1 . . . . .	3:4315
	7,8-Dichloronaphthol-1 . . . . .	3:2635
$C_{10}H_7OCl$	1-Chloronaphthol-2 . . . . .	3:1700
	3-Chloronaphthol-2 . . . . .	3:2545
	4-Chloronaphthol-2 . . . . .	3:3045
	5-Chloronaphthol-2 . . . . .	3:3945
	6-Chloronaphthol-2 . . . . .	3:3500
	7-Chloronaphthol-2 . . . . .	3:3925
	8-Chloronaphthol-2 . . . . .	3:2965
$C_{10}H_6OCl_2$	1,3-Dichloronaphthol-2 . . . . .	3:1990
	1,4-Dichloronaphthol-2 . . . . .	3:3840
	1,6-Dichloronaphthol-2 . . . . .	3:3600
	3,4-Dichloronaphthol-2 . . . . .	3:3295
	4,8-Dichloronaphthol-2 . . . . .	3:4420
	5,8-Dichloronaphthol-2 . . . . .	3:4155

$C_7H_4O_2Cl_2$	2,6-Dichloro-3-hydroxybenzaldehyde. . . . .	3:4160
Contd.	4,6-Dichloro-3-hydroxybenzaldehyde. . . . .	3:3952
	3,5-Dichloro-4-hydroxybenzaldehyde. . . . .	3:4400
$C_7H_3O_2Cl_3$	2,4,6-Trichloro-3-hydroxybenzaldehyde. . . . .	3:3520

## B. Of Ketones

## 1. Dialkyl ketones

$C_3H_5OCl$	Chloroacetone. . . . .	3:5425
$C_3H_4OCl_2$	$\alpha,\alpha$ -Dichloroacetone. . . . .	3:5430
	$\alpha,\alpha'$ -Dichloroacetone. . . . .	3:0563
$C_3H_3OCl_3$	$\alpha,\alpha,\alpha$ -Trichloroacetone. . . . .	3:5620
	$\alpha,\alpha,\alpha'$ -Trichloroacetone. . . . .	3:5957
$C_3H_2OCl_4$	$\alpha,\alpha,\alpha,\alpha'$ -Tetrachloroacetone. . . . .	3:6035
	$\alpha,\alpha,\alpha',\alpha'$ -Tetrachloroacetone. . . . .	3:6050
$C_5H_7OCl_3$	Pentachloroacetone. . . . .	3:6205
$C_7OCl_4$	Hexachloroacetone. . . . .	3:6312
$C_4H_7OCl$	1-Chlorobutanone-2. . . . .	3:8012
	3-Chlorobutanone-2. . . . .	3:7593
	4-Chlorobutanone-2. . . . .	3:7640
$C_4H_6OCl_2$	1,3-Dichlorobutanone-2. . . . .	3:5900
$C_5H_5OCl$	1-Chloropentanone-2. . . . .	3:8217
	3-Chloropentanone-2. . . . .	3:7893
	4-Chloropentanone-2. . . . .	3:8243
	5-Chloropentanone-2. . . . .	3:9267
	1-Chloropentanone-3. . . . .	3:9268
	2-Chloropentanone-3. . . . .	3:7935
	1-Chloro-2-methylbutanone-3. . . . .	3:0269
	2-Chloro-2-methylbutanone-3. . . . .	3:7597
2. Alicyclic ketones		
$C_6H_8OCl$	2-Chlorocyclohexanone-1. . . . .	3:0120
	3-Chlorocyclohexanone-1. . . . .	3:9360
	4-Chlorocyclohexanone-1. . . . .	3:9364

$C_8OCl_2$	Hexachlorocyclohexadien-2,5-one-1 ("Hexachlorophenol") . . . . .	3:3180
$C_8O_2Cl_2$	1,2,3,4,6,6-Hexachlorocyclohexen-1-dione-3,5 ("Hexachlororesorcinol") . . . . .	3:3470
	2,3,5,5,6,6-Hexachlorocyclohexen-2-dione-1,4. . . . .	3:2360

## 3. Alkyl aryl ketones

## a. With chlorine only in alkyl

$C_8H_7OCl$	$\omega$ -Chloroacetophenone. . . . .	3:1212
$C_8H_6OCl_2$	$\omega,\omega$ -Dichloroacetophenone. . . . .	3:6835
$C_8H_5OCl_3$	$\omega,\omega,\omega$ -Trichloroacetophenone. . . . .	3:6847
$C_9H_7OCl$	$\alpha$ -Chloroethyl phenyl ketone. . . . .	3:0664
	$\beta$ -Chloroethyl phenyl ketone. . . . .	3:1115
	$\omega$ -Chloro- $\alpha$ -methylacetophenone. . . . .	3:9660
	$\omega$ -Chloro- $p$ -methylacetophenone. . . . .	3:1130
$C_{10}H_{11}OCl$	$\omega$ -Chloro-2,4-dimethylacetophenone. . . . .	3:1355
	$\omega$ -Chloro-2,5-dimethylacetophenone. . . . .	3:0245
	$\omega$ -Chloro-3,4-dimethylacetophenone. . . . .	3:1775
$C_{10}H_{10}OCl$	$p$ -Phenylphenacyl chloride. . . . .	3:3931
	$\alpha$ -Chlorobenzyl phenyl ketone. . . . .	3:1618

## b. With chlorine both in alkyl and aryl

$C_{10}H_9OCl_2$	$p$ -Chlorophenacyl chloride. . . . .	3:2990
------------------	---------------------------------------	--------

## c. With chlorine only in aryl

$C_8H_7OCl$	$o$ -Chloroacetophenone. . . . .	3:6615
	$m$ -Chloroacetophenone. . . . .	3:6315
	$p$ -Chloroacetophenone. . . . .	3:6735
$C_8H_5OCl$	$p$ -Chlorophenyl ethyl ketone. . . . .	3:0340

## 4. Diaryl ketones

$C_{12}H_9OCl$	2-Chlorobenzophenone. . . . .	3:0715
	3-Chlorobenzophenone. . . . .	3:2160
	4-Chlorobenzophenone. . . . .	3:1914

## b. Unsaturated

$C_3H_3OCl$   $\alpha$ -Chloroacrolein..... 3:9031

$C_4H_5OCl$   $\alpha$ -Chlorocrotonaldehyde..... 3:8117

## c. Relatives of the above

c<sub>1</sub> HYDRATES

$C_2H_4O_2Cl_2$  Dichloroacetaldehyde hydrate. . . . . 3:1085

$C_2H_3O_2Cl_2$  Chloral hydrate. . . . . 3:1270

$C_4H_7O_2Cl_3$  Butyrehloral hydrate. . . . . 3:1905

c<sub>2</sub> HEMIACETALS

$C_4H_8O_2Cl_2$  Dichloroacetaldehyde ethyl alcoholate.... 3:5310

$C_4H_7O_2Cl_2$  Chloral ethyl alcoholate. . . . . 3:0860

$C_6H_{11}O_2Cl_3$  Chloral *n*-butylalcoholate..... 3:0843

c<sub>3</sub> DIETHYLACETALS

$C_6H_{13}O_2Cl_2$  Chloroacetaldehyde diethylacetal..... 3:8223

$C_6H_{13}O_2Cl_2$  Dichloroacetaldehyde diethylacetal. . . . 3:6110

$C_6H_{11}O_2Cl_3$  Chloral diethylacetal. . . . . 3:6317

$C_7H_{15}O_2Cl$   $\beta$ -Chloropropionaldehyde diethylacetal.. 3:9490

$C_6H_{17}O_2Cl$   $\beta$ -Chloro-*n*-butyraldehyde diethylacetal 3:9594

c<sub>4</sub> ACETALS WITH CHLORINE ONLY IN ALCOHOL RADICALS

$C_6H_{12}O_2Cl_2$  Formaldehyde  $\beta,\beta'$ -dichloroisopropylethyl-acetal . . . . . 3:9394  
Acetaldehyde bis-( $\beta$ -chloroethyl)acetal.. 3:6210

c<sub>5</sub> POLYMERS

$C_6H_9O_2Cl_3$  Parachloroacetaldehyde..... 3:2300

$C_{12}H_{21}O_2Cl_2$  Para- $\beta$ -chloro-*n*-butyraldehyde..... 3:2650

Para- $\alpha$ -chloro-*n*-butyraldehyde..... 3:3220

## 2. Aromatic aldehydes

## a. Simple aldehydes

$C_7H_7OCl$  *o*-Chlorobenzaldehyde 3:6410

*m*-Chlorobenzaldehyde 3:6475

*p*-Chlorobenzaldehyde 3:0765

$C_7H_4OCl_2$  2,3-Dichlorobenzaldehyde..... 3:1480

2,4-Dichlorobenzaldehyde..... 3:1800

2,5-Dichlorobenzaldehyde . . . . . 3:1145

2,6-Dichlorobenzaldehyde . . . . . 3:1690

3,4-Dichlorobenzaldehyde . . . . . 3:0550

3,5-Dichlorobenzaldehyde... . . . . 3:1475

$C_7H_5OCl_3$  2,3,4-Trichlorobenzaldehyde. . . . . 3:2445

2,3,5-Trichlorobenzaldehyde. . . . . 3:1060

2,3,6-Trichlorobenzaldehyde.. . . . 3:2287

2,4,5-Trichlorobenzaldehyde . . . . . 3:3375

2,4,6-Trichlorobenzaldehyde . . . . . 3:1200

3,4,5-Trichlorobenzaldehyde . . . . . 3:2440

$C_7H_2OCl_4$  2,3,4,5-Tetrachlorobenzaldehyde.. . 3:3140

2,3,4,6-Tetrachlorobenzaldehyde..... 3:2700

2,3,5,6-Tetrachlorobenzaldehyde..... 3:2700

$C_7HOCl_5$  Pentachlorobenzaldehyde . . . . . 3:4892

## b. Phenolic aldehydes

$C_7H_5O_2Cl$  3-Chloro-2-hydroxybenzaldehyde..... 3:1010

4-Chloro-2-hydroxybenzaldehyde..... 3:0960

5-Chloro-2-hydroxybenzaldehyde. . . . . 3:2800

2-Chloro-3-hydroxybenzaldehyde..... 3:4085

4-Chloro-3-hydroxybenzaldehyde..... 3:3780

6-Chloro-3-hydroxybenzaldehyde..... 3:3350

2-Chloro-4-hydroxybenzaldehyde..... 3:4280

3-Chloro-4-hydroxybenzaldehyde..... 3:4065

$C_7H_4O_2Cl_2$  3,5-Dichloro-2-hydroxybenzaldehyde..... 3:2637

2,4-Dichloro-3-hydroxybenzaldehyde. . 3:4140

## B. OF ISOCYCLIC ACIDS.

## 1. With no other functional group.

a. Monobasic.

b. Dibasic.

c. Tribasic.

## 2. With some other functional group.

a. Phenolic acids.

b. Ether acids.

## C. ANHYDRIDES OF ACYCLIC ACIDS.

## 1. Saturated.

## 2. Unsaturated.

## D. ANHYDRIDES OF ISOCYCLIC ACIDS.

UNIT 6. CHLORO SUBSTITUTION PRODUCTS OF CARBOXYLIC ACIDS  
AND ANHYDRIDES

(For acyl chlorides see Unit 7)

## A. Of Acyclic Acids

## 1. With no other functional group

## a. Saturated monobasic

 $C_2H_3O_2Cl$  Chloroacetic acid..... 3:1370 $C_2H_3O_2Cl_2$  Dichloroacetic acid... 3:6208 $C_2HO_2Cl_3$  Trichloroacetic acid... 3:1150 $C_3H_5O_2Cl$   $\alpha$ -Chloropropionic acid 3:6125  
 $\beta$ -Chloropropionic acid 3:0160 $C_3H_4O_2Cl_2$   $\alpha,\alpha$ -Dichloropropionic acid..... 3:6162  
 $\alpha,\beta$ -Dichloropropionic acid.... 3:0855  
 $\beta,\beta$ -Dichloropropionic acid..... 3:1058 $C_3H_3O_2Cl_3$   $\alpha,\alpha,\beta$ -Trichloropropionic acid..... 3:1275 $C_3H_2O_2Cl_4$   $\alpha,\alpha,\beta,\beta$ -Tetrachloropropionic acid ..... 3:1850 $C_2HO_2Cl_5$  Pentachloropropionic acid..... 3:4895 $C_4H_7O_2Cl$   $\alpha$ -Chloro-*n*-butyric acid..... 3:9130  
 $\beta$ -Chloro-*n*-butyric acid..... 3:0035  
 $\gamma$ -Chloro-*n*-butyric acid..... 3:0020 $C_4H_6O_2Cl_2$   $\alpha,\beta$ -Dichloro-*n*-butyric acid  
Higher-melting isomer 3:1903  
Lower-melting isomer. 3:1375 $C_4H_3O_2Cl_3$   $\alpha,\alpha,\beta$ -Trichloro-*n*-butyric acid..... 3:1280 $C_4H_3O_2Cl_3$   $\alpha,\alpha,\gamma$ -Trichloro-*n*-butyric acid..... 3:1831  
Contd.  $\alpha,\beta,\beta$ -Trichloro-*n*-butyric acid..... 3:0925  
 $\gamma,\gamma,\gamma$ -Trichloro-*n*-butyric acid..... 3:1000 $C_4H_7O_2Cl$   $\alpha$ -Chloroisobutyric acid..... 3:0235  
 $\beta$ -Chloroisobutyric acid..... 3:0132 $C_5H_9O_2Cl$   $\alpha$ -Chloro-*n*-valeric acid 3:8783

 $\gamma$ -Chloro-*n*-valeric acid 3:9270  
 $\delta$ -Chloro-*n*-valeric acid 3:0075 $\alpha$ -Chloro- $\alpha$ -methyl-*n*-butyric acid ..... 3:8718  
 $\alpha$ -Chloro- $\beta$ -methyl-*n*-butyric acid..... 3:0050 $\beta$ -Chloro- $\alpha,\alpha$ -dimethylpropionic acid..... 3:0440

## b. Saturated dibasic

 $C_4H_4O_4Cl_2$  *dl*- $\alpha,\alpha'$ -Dichlorosuccinic acid..... 3:4711  
*meso*- $\alpha,\alpha'$ -Dichlorosuccinic acid..... 3:4930

## c. Unsaturated (olefinic) monobasic

 $C_3H_3O_2Cl$   $\alpha$ -Chloroacrylic acid.. 3:1445  
 $\beta$ -Chloroacrylic acid.. 3:2210 $C_3H_4O_2Cl_2$   $\alpha,\beta$ -Dichloroacrylic acid..... 3:2265  
 $\beta,\beta$ -Dichloroacrylic acid..... 3:1875 $C_4HO_2Cl_3$   $\alpha,\beta,\beta$ -Trichloroacrylic acid..... 3:1840

# CHAPTER IV

## DIVISION A. SOLIDS

(3:1000-3:1499)

3:1000  $\gamma,\gamma,\gamma$ -TRICHLORO-*n*-BUTYRIC ACID  $C_4H_5O_2Cl_3$  Beil. S.N. 162  
 $Cl_3C.CH_2.CH_2.COOH$

M.P. 55° (1)

Colorless ndls. from hot aq.

[For prepn. of  $\bar{C}$  from  $\gamma,\gamma,\gamma$ -trichloro-*n*-butyronitrile (see below) by hydrolysis with conc. HCl at 60° for 6 hrs. see (1).]

— $\gamma,\gamma,\gamma$ -Trichloro-*n*-butyronitrile: ndls. from pet. ether, m.p. 41° u.c.; b.p. 214-216° at 760 mm., 90-95° at 12 mm. (1). [From acrylonitrile with  $CHCl_3$  in pres. of aq. trimethylbenzylammonium hydroxide at 0.5° for 24 hrs. (11% yield (1)).] [Note that this nitrile upon acid hydrolysis gives  $\bar{C}$ , but upon alkaline hydrolysis gives succinic acid (1:0530), m.p. 188-189° (1).]

— $\gamma,\gamma,\gamma$ -Trichloro-*n*-butyramide: cryst. from toluene, m.p. 89-90° u.c. (1). [From  $\gamma,\gamma,\gamma$ -trichloro-*n*-butyronitrile (above) with 27%  $H_2O_2$  + aq. NaOH at 40-45° for 5 hrs. (1).]

3:1000 (1) Bruson, Niederhauser, Riener, Hester, *J. Am. Chem. Soc.* 67, 601 (1945).

3:1010 3-CHLORO-2-HYDROXYBENZALDE-  $C_7H_5O_2Cl$  Beil. VIII —  
 HYDE  VIII<sub>1</sub>-(523)  
 (3-Chlorosalicylaldehyde)

M.P. 55° (1)

54.5-55.5° (2)

54° (3) (4)

Long colorless ndls. from MeOH (1). — Readily sol. in usual org. solvents (1). — Volatile with steam [diff. from 3-chloro-4-hydroxybenzaldehyde (3:4065) (1)].

[For prepn. from *o*-chlorophenol (3:5980) with  $CHCl_3$  + alk. (10-15% yield (1)) or via condensation with formalin + alk. to 3-chloro-2-hydroxybenzyl alc. and oxidn. of latter with Na *m*-nitrobenzenesulfonate + alk. (2) see indic. refs.; from 3-chloro-2-hydroxybenzoic acid (3-chlorosalicylic ac.) (3:4745) by reductn. with Na/Hg in pres. of  $H_3BO_3$  see (4).]

$\bar{C}$  with satd. aq.  $NaHSO_3$  soln. yields  $NaHSO_3$  cpd. (1) (2).

$\bar{C}$  dissolves in aq. alk. with yel. color (4) (2).

$\bar{C}$  with aq.  $FeCl_3$  yields violet-red color (2).

$\bar{C}$  is not nitrated by cold  $AcOH/HNO_3$  soln. (1); but  $\bar{C}$  (2 g.) in  $AcOH$  (10 ml.) treated at 45° for 15 min. with soln. of 0.8 ml. conc.  $HNO_3$  ( $D = 1.42$ ) in  $AcOH$  (4 ml.), then poured into aq., gives (1) 2.15 g. 3-chloro-5-nitro-2-hydroxybenzaldehyde, yel. ndls. from dil. alc., m.p. 129° (1).

The methyl ether of  $\bar{C}$ , viz., 3-chloro-2-methoxybenzaldehyde, is a liq., h.p. abt. 255°, f.p. 0° (1).

## UNIT 7. ACYL CHLORIDES

(Summary of Classification of Unit 7)

## A. OF ACYCLIC ACIDS (R.CO.Cl).

## 1. The radical (R) contains no chlorine.

- a. Corresponding acid is saturated and monobasic.
- b. Corresponding acid is saturated and dibasic.
- c. Corresponding acid is unsaturated and monobasic.
- d. Corresponding acid is unsaturated and dibasic.
- e. Corresponding acid contains also other functional groups.
  - e<sub>1</sub> Ether/acyl chloride.
  - e<sub>2</sub> Ester/acyl chloride.
  - e<sub>3</sub> Keto/acyl chloride.

## 2. The radical (R) does contain chlorine.

- a. Corresponding acid is saturated and monobasic.
- b. Corresponding acid is saturated and dibasic.
- c. Corresponding acid is unsaturated and monobasic.
- d. Corresponding acid is unsaturated and dibasic.
- e. Corresponding acid contains other functional groups.

## B. OF ISOCTYLIC ACIDS.

## 1. The radical (R) contains no chlorine.

- a. Corresponding acid is monobasic.
  - a<sub>1</sub> With —COOH group attached to ring.
  - a<sub>2</sub> With —COOH group attached to saturated side chain.
  - a<sub>3</sub> With —COOH group attached to unsaturated side chain.
  - a<sub>4</sub> With —COOH group attached to ring containing another functional group.
- b. Corresponding acid is dibasic.

## 2. The radical (R) does contain chlorine.

- a. Corresponding acid is monobasic.

## C. OF HETEROCYCLIC ACIDS.

## 1. The radical (R) contains no chlorine.

- a. Corresponding acid is monobasic.

## UNIT 7. ACYL CHLORIDES

## A. OF ACYCLIC ACIDS (R.CO.OH)

## 1. The radical (R) contains no chlorine

- a. Corresponding acid is saturated and monobasic

### 3:1020 4,6-DICHLORO-2-METHYLPHENOL

 $C_7H_6OCl_2$ 

Beil. VI - 359

 (4,6-Dichloro-*o*-cresol)

 VI<sub>1</sub>-(174)

 VI<sub>2</sub>-(332)

M.P. 56° (1)	B.P. 226.5° (1)
55° (2) (7)	131° at 28 mm. (5)
54-55° (3)	73-78° at 4 mm. (6)
54° u.c. (1)	
53-51° (5)	

Ndls. from hot aq. or pet. ether. Spar. sol. cold but more eas. sol. hot aq.; eas. sol. alc., ether,  $CHCl_3$ ,  $CS_2$ . Volatile with steam.

[For prepn. of  $\bar{C}$  from *o*-cresol (1.1400) with  $Cl_2$  (7) (1) in  $CCl_4$  (61% yield (2)) in  $CCl_4$  in pres. of  $I_2$  (8) or in pres. of  $PCl_5$  in sunlight at elevated temp. (8), with  $Cl_2$  in NaOH soln. at room temp. (5), or with  $SO_2Cl_2$  (3), see indic. refs.; for formn. from 2-methylphenolsulfonic acid-4,6 (6) in nitrobenzene with  $Cl_2$  (other products are also formed) see (6).]

[ $\bar{C}$  with dry  $NH_3$  gas at room temp. (9) forms a cpd.,  $\bar{C} \cdot 2NH_3$  (9);  $\bar{C}$  on evapn. of alc.  $NH_3$  soln. does not give an  $NH_3$  salt but is recovered unchanged (dif. from 2,6-dichloro-4-methylphenol (3:0400) q.v.) (7) ]

[ $\bar{C}$  (1 pt.) in 2 pts. ice-cold  $HNO_3$  ( $D = 1.45$ ) stood 24 hrs. gives (37% yield (2)) a prod. of compn.  $C_7H_4O_4N_2Cl_2$ , white ndls. from dry ether by pptn. with pet. ether, m.p. 109° dec. (2) ]

[ $\bar{C}$  with boilg. dil.  $HNO_3$  oxidizes (7) to oxalic acid (1.0115);  $\bar{C}$  on oxidn. with  $K_2Cr_2O_7$  + dil.  $H_2SO_4$  gives (4) 6-chloro-2-methylbenzoquinone-1,4 (6-chloro-*p*-toluquinone) [Boil. VII-650, VII<sub>1</sub>-(353)], yel ndls., vol. with steam, m.p. 90° (4);  $\bar{C}$  digested with aqua regia for 1½ hrs. at 100° gives (16% yield (5)) 3,5,6-trichloro-2-methylbenzoquinone-1,4 (trichloro-*p*-toluquinone) [Boil. VII-651, VII<sub>1</sub>-(351)], yel lfts. from alc., m.p. 231° (5);  $\bar{C}$  with  $CrO_3$ /AcOH gives a mixt. (1) of chlorinated quinones ]

[ $\bar{C}$  does not react with  $PCl_5$  (10);  $\bar{C}$  on monosulfonation with fuming  $H_2SO_4$  (65%  $SO_3$ ) at 50° yields (11) 4,6-dichloro-2-methylphenolsulfonic acid-3; for condensation of  $\bar{C}$  with benzaldehydesulfonic acid-1 and use as methylating agt. see (12) ]

[ $\bar{C}$  in MeOH/KOH refluxed 6½ hrs. with MeI (74% yield (1)), or  $\bar{C}$  in aq. alk. with  $MgSO_4$  (1) gives the corresp. methyl ether (4,6-dichloro-2-methylphenylether), m.p. 37° (1), 2-30° (3), b.p. 230° (1);  $\bar{C}$  in aq. alk. soln. treated with  $H_2SO_4$  gives (1) corresp. ethyl ether (4,6-dichloro-2-methylphenylether), m.p. 27.5° (1) ]

## V. ALPHABETICAL NAME INDEX TO COMPOUNDS OF ORDER 3

1. Note that this index refers only to numbered compounds of Order 3; for practical reasons it cannot include the large number of related products which are incidentally mentioned within the text of these numbered individuals.

2. In this alphabetical name index all literal prefixes (such as those below) are ignored in establishing the alphabetical sequence. Note, however, that "iso" is not recognized as a prefix but is construed as an integral part of the name and therefore indexed under the letter I.

3. Within any given group of related prefixes the following sequences are employed:

*d,l*- . . . *allo*- . . . *meso*-  
*erythro*- . . . *threo*-  
*cis*- . . . *trans*-  
*prim.*- . . . *sec.*- . . . *ter*-  
*sym.*- . . . *unsym.*-

*h*-*m*. . . *l*-*m*.  
*o*- . . . *m*- . . . *p*-  
 $\alpha$ - . . .  $\beta$ - . . .  $\gamma$ - . . .  $\delta$ - . . .  $\omega$ -  
*bis*- . . . *tris*-  
solid . . . liquid

4. Note that except when needed to distinguish from other stereoisomers the prefix *d,l* is omitted from the alphabetical index names even when included in text of the individual compound.

5. Whenever in a particular name the syllable (di) is inserted in parentheses to avoid possible ambiguity, such syllable is ignored in establishing the alphabetical sequence.

6. For a given family of derivatives of the same halogen-free parent, the sequence of listing is based upon the parent, e.g., all the dichloro substitution products of naphthol-1 precede all those derived from naphthol-2.

A			
3:6210	Acetaldehyde <i>bis</i> -( $\beta$ -chloroethyl)-acetal	3:8150	2-Acetoxy-1-chloropropano
3:9098	Acetoacetyl chloride	3:8160	1-Acetoxy-2-chloropropano
3:6317	$\beta$ -Aceto- $\alpha$ -chlorohydrin	3:8310	1-Acetoxy-3-chloropropano
3:6775	$\gamma$ -Aceto- $\alpha$ -chlorohydrin	3:7065	Acetyl chloride
3:6618	$\alpha$ -Aceto- $\beta$ -chlorohydrin	3:5012	<i>cis</i> -Acetyleno dichloride
3:6720	$\gamma$ -Aceto- $\alpha,\beta$ -dichlorohydrin	3:5028	<i>trans</i> -Acetyleno dichloride
3:6318	$\beta$ -Aceto- $\alpha,\gamma$ -dichlorohydrin	3:5030	Acetylene dichloride (ordinary mixt.)
3:7140	"Acetone (di)chloride"	3:5750	Acetylene tetrachloride
3:2662	Acetone chloroform	3:5555	Acetylidene tetrachloride
3:6180	"Acetone chloroform" acetate	3:9034	Acrolein dichloride
3:5425	Acetonyl chloride	3:5140	"Acrolein dichloride"
		3:5576	Acrolein hydrochloride

3:0015	1-Chlorohexadecane	3:4950	4-Chloroisophthalic acid
3:0525	16-Chlorohexadecanol-1	3:4960	5-Chloroisophthalic acid
3:0525	$\omega$ -Chloro- <i>n</i> -hexadecyl alcohol	3:7290	" $\beta$ -Chloroisoprene"
3:9312	3-Chlorohexadiene-1,3	3:8150	$\beta$ -Chloro-isopropyl acetate
3:0945	Chlorohexamethylethane	3:7747	$\beta$ -Chloro-isopropyl alcohol
3:7955	1-Chlorohexane	3:9610	$\alpha$ -Chloro-isopropylbenzene
3:7715	2-Chlorohexane	3:8705	4-Chloro-isopropylbenzene
3:7670	3-Chlorohexane	3:8605	4-Chloro-isopropylbenzene - bis-( $\beta$ -Chloro-isopropyl) ether
3:9395	6-Chlorohexanol-1	3:8775	2-Chloro-4-isopropyl-1-methyl- benzene
3:7735	3-Chlorohexatetraene-1,3,4,5	3:8770	3-Chloro-4-isopropyl-1-methyl- benzene
3:7630	1-Chlorohexene-1	3:9290	$\alpha$ -Chloroisopropyl-methyl- carbinol
3:7530	2-Chlorohexene-1	3:1293	4-Chloro-2-isopropyl-5-methyl- phenol
3:9334	3-Chlorohexene-1	3:0480	4-Chloro-5-isopropyl-2-methyl- phenol
3:7655	4-Chlorohexene-1	3:3220	2,4,6- <i>tris</i> -( $\alpha$ -Chloro-isopropyl)- trioxane-1,3,5
3:7665	5-Chlorohexene-1	3:0050	$\alpha$ -Chloro-isovaleric acid
3:7620	1-Chlorohexene-2	3:8144	$\alpha$ -Chloro-isovaleryl chloride
3:7675	4-Chlorohexene-2	3:9088	$\gamma$ -Chloro- $\beta$ -keto- <i>n</i> -butyryl chloride
3:0336	<i>cis</i> -1-Chlorohexene-3	3:0172	$\omega$ -Chlorolauryl alcohol
3:7535	3-Chlorohexene-3	3:3432	Chloromaleic acid
3:9395	$\omega$ -Chloro- <i>n</i> -hexyl alcohol	3:0280	Chloromaleic anhydride
3:9320	1-Chlorohexyne-1	3:6158	Chloromaleyl (di)chloride
3:3130	2-Chlorohydroquinone	3:8725	<i>eso</i> -Chloromesitylene
3:1010	3-Chloro-2-hydroxybenzaldehyde	3:7005	Chloromethane
3:0960	4-Chloro-2-hydroxybenzaldehyde	3:8210	3-Chloro-3-methoxyethylpentane
3:2800	5-Chloro-2-hydroxybenzaldehyde	3:5356	Chloromethyl acetate
3:4095	2-Chloro-3-hydroxybenzaldehyde	3:9660	$\omega$ -Chloro- <i>o</i> -methylacetophenone
3:3780	4-Chloro-3-hydroxybenzaldehyde	3:1130	$\omega$ -Chloro- <i>p</i> -methylacetophenone
3:3350	6-Chloro-3-hydroxybenzaldehyde	3:8340	$\gamma$ -Chloro- $\beta$ -methylallyl alcohol
3:4280	2-Chloro-4-hydroxybenzaldehyde	3:4435	3-Chloro-2-methylbenzoic acid
3:4065	3-Chloro-4-hydroxybenzaldehyde	3:4700	4-Chloro-2-methylbenzoic acid
3:3350	2-Chloro-5-hydroxybenzaldehyde	3:4670	5-Chloro-2-methylbenzoic acid
3:4745	3-Chloro-2-hydroxybenzoic acid	3:3275	6-Chloro-2-methylbenzoic acid
3:4908	4-Chloro-2-hydroxybenzoic acid	3:4915	4-Chloro-3-methylbenzoic acid
3:4705	5-Chloro-2-hydroxybenzoic acid	3:4715	5-Chloro-3-methylbenzoic acid
3:4610	6-Chloro-2-hydroxybenzoic acid	3:4615	6-Chloro-3-methylbenzoic acid
3:4395	2-Chloro-3-hydroxybenzoic acid	3:4355	2-Chloro-4-methylbenzoic acid
3:4933	4-Chloro-3-hydroxybenzoic acid	3:4900	3-Chloro-4-methylbenzoic acid

3:1025 3-CHLORO-4-METHYLPHENOL  
(3-Chloro-*p*-cresol)

 $C_7H_7OCl$ 

Beil. VI-402

 VI<sub>1</sub>-

 VI<sub>2</sub>-

M.P. 55° (1) (2) B.P. 228° at 760 mm. (2)  
229° at 735 mm. (1)

Long colorless ndls., markedly sol. in aq. and volatile with steam (1). — Eas. sol. alc., ether, or  $C_6H_6$ .

[For prepn. (77% yield) from 3-chloro-4-methylaniline [Beil. XII-983] via diazo reaction see (1).]

$\bar{C}$  dislyd. in 20% NaOH and shaken with  $(CH_3)_2SO_4$  gives 95% yield of corresponding methyl ether, viz., 3-chloro-4-methylanisole, b.p. 212° (1). [Oxidn. of this ether with dil. aq.  $KMnO_4$  yields (1) 2-chloro-4-methoxybenzoic acid [Beil. X-175], ndls. from aq., m.p. 208° (1).]

3:1040 o-XYLYLENE (DI)CHLORIDE  
( $\omega,\omega'$ -Dichloro-*o*-xylene)

 $C_8H_8Cl_2$ 

Beil. V-364

 V<sub>1</sub>-

 V<sub>2</sub>-(283)

M.P. 55° (1) (2) B.P. 239-241° (3)  
54.6-54.8° (3) 130-135° at 19 mm. (2)  
54-55° cor. (5)

Cryst. (from pet. eth.). — Sublimes. — Sol. alc., ether,  $CHCl_3$ , lgr. Powerful lachry-mator.

[For prepn. from *o*-xyleneglycol + boilg. conc.  $HCl$  see (3); from *o*-xylene (1:7430) +  $PCl_5$  at 190° see (3) (4); from *o*-xylene (1:7430) +  $Cl_2$  in sunlight see (1); for formn. of  $\bar{C}$  (13%) during chloromethylation of benzyl chloride (3:8535) see (5).]

$\bar{C}$  on oxidn. with  $KMnO_4$  yields phthalic ac. (1:0820).

## 3:4170 3-CHLORONAPHTHOL-1

 $C_{10}H_7OCl$ 

Beil. VI —

VI<sub>1</sub>—VI<sub>2</sub>-(581)

M.P. 143° (1)

134-135° (2)

Ndls. from lgr. (2),  $C_6H_6$ , alc. or 80% AcOH (1). — Volatile with steam (1).

[For prepn. of  $\bar{C}$  from 3-chloronaphthylamine-1 (1) via diazotization and hydrolysis of the diazonium salt with steam see (1); from 2,3,4-trichloronaphthol-1 [Beil. VI-612] by partial reduction with H1 ( $D = 1.7$ ) in AcOH on oilg. 7 hrs. (100% yield) see (2)]

 $\bar{C}$  is sol in aq alk., and the result. soln. couples with solns. of diazonium salts (1).

$\bar{C}$  with  $Br_2$  aq. (and alk.?) gives 3-chloro-2,4-dibromonaphthol-1, pr. from 90% formic acid, m.p. 112° (1).

[ $\bar{C}$  in 10% aq KOH shaken with  $Me_2SO_4$  for 20 min. gives (81% yield (2)) 3-chloronaphthol-1 methyl ether, oil, b.p. 162-164° at 18 mm. (2).]

③ 3-Chloro-1-naphthyl acetate: ndls. from lgr., m.p. 69° (2). [From  $\bar{C}$  with acetyl chloride in  $C_6H_6$  on refluxing 3 hrs. in  $C_6H_6$  (66% yield (2)).]

④ 3-Chloro-1-naphthyl benzoate: ndls. from lgr., m.p. 118-119° (2). [From  $\bar{C}$  in 10% aq. KOH on shaking with  $BzCl$  (71% yield (2)).]

3:4170 (1) Hodgson, Elliott, *J. Chem. Soc.* 1934, 1707. (2) Franzen, Stäuble, *J. prakt. Chem.* (2) 103, 385-387 (1922).

## 3:4200 2,6-DICHLORO BENZOIC ACID

 $C_7H_4O_2Cl_2$ 

Beil. IX - 343

IX<sub>1</sub>-(141)

M.P. 144° (1) (2)

143.7° (3)

143-144° (4)

141.5-142.5° (5)

Many recorded m.p.'s lower than these values [cf. Beil. IX-343 and (3)] were on sample now known to have been impure.

Cryst. from lgr. (1) or mixt. of  $C_6H_6$  + lgr. (4) (3); pr. from aq., thls. from  $C_6H_6$ , ndl from alc. — Can also be purified by distn. in vac. (1). — Volatile with steam (?).

[For prepn. of  $\bar{C}$  from 2,6-dichlorotoluene (3:6270) (57% yield (4)) via brominat to 2,6-dichlorobenzyl bromide, conversion to corresp. acetate, and oxidn. of latter v  $KMnO_4$  see (1) (4); from 2,6-dichlorobenzaldehyde by oxidn. with  $KMnO_4$  see (2); older less satisfactory methods see Beil. IX-343.]

$\bar{C}$  on htg. begins to lose  $CO_2$  at 235° (5). [ $\bar{C}$  htd. with a large excess 50% aq. KOH 150° for 24 hrs. was recovered unchanged to extent of 90% (9).]

$\bar{C}$  on nitration under stated conditions (1) gives 94% yield 2,6-dichloro-3-nitrobenzoic acid, cryst. from toluene, m p. 152° (1).

$\bar{C}$  (as  $K\bar{A}$ ) htd. with aniline +  $K_2CO_3$  + Cu in amyl alc. gives small yield of diphenyl aminocarboxylic acid-2, cryst. from  $C_6H_6$ , m.p. 181° (1). [Note loss of both chlorine atoms.]

$\bar{C}$  htd. with acetamide for 6 hrs. at 225-235° gave 93% yield (5) *m*-dichlorobenzen (3:5960), b.p. 172°.

$\bar{C}$  htd. with  $PCl_5$  (6) or with  $SOCl_2$  + pyridine (4) yields 2,6-dichlorobenzoyl chloride, h.p. 142-143° at 21 mm. (6), 126-128° at 18 mm. (7).

3:1055 2-CHLORO-3-METHYLPHENOL  
(2-Chloro-*m*-cresol)

C<sub>7</sub>H<sub>7</sub>OCl

Beil. VI —

VI<sub>1</sub>—VI<sub>2</sub>-(353)

M.P. 55-56° (1) B.P. abt. 194° (1)  
49-50° (2)

Transparent cryst. (1) (2) from pet. eth. — Very spar sol cold aq.; pronounced phenolic odor (1).

[For prepn. from *m*-cresoldisulfonic acid by chlorination see (2); from 2-nitro-3-methylphenol via 2-amino-3-methylphenol see (2), from 2-chloro-3-methylanisole by boilg. with HI see (1).]

$\bar{C}$  treated with (CH<sub>3</sub>)<sub>2</sub>SO<sub>4</sub> + aq NaOH gives its methyl ether, 2-chloro-3-methylanisole, pr. from light pet. eth., m.p. 24.2°, b.p. 218.5° (1) [This methyl ether on oxidn. with dil. KMnO<sub>4</sub> (7¼ hrs. for 5 g.) gave (1) 2-chloro-3-methoxybenzoic acid, stout colorless rectangles, m.p. 160.5° (1), 160° (3), Neut. Eq. 186.5.]

② 2-Chloro-3-methylphenyl benzoate: from  $\bar{C}$  + BzCl + pyridine, pr. from alc., m.p. 55-56° (2). [Note that this value is numerically the same as  $\bar{C}$  and that the deriv. must be distinguished from orig.  $\bar{C}$ , e.g., by mixed m.p. or behavior with alk.]

③ 2-Chloro-3-methylphenyl benzenesulfonate: from  $\bar{C}$  + benzenesulfonyl chloride + pyridine; pl. from alc., m.p. 58-58.5° (2) [See note for above deriv.]

④ 2-Chloro-3-methylphenyl *p*-toluenesulfonate: from  $\bar{C}$  + *p*-toluenesulfonyl chloride + pyridine; pr. from alc. m.p. 90° (2) [Note that this deriv. does not distinguish  $\bar{C}$  from 6-chloro-3-methylphenol (3:0700) or 4-chloro-3-methylphenol (3:1535).]

3:1053 (1) Gibson, J. Chem. Soc. 1926, 1424-1428 (2) Huston, Chem. J. Am. Chem. Soc. 55, 4214-4218 (1933). (3) Hodgson, Beard, J. Chem. Soc. 1926, 150

3:1057 4,4'-DICHLORODIPHENYL-  
METHANE  
(Di-(*p*-chlorophenyl)methane)

C<sub>12</sub>H<sub>10</sub>Cl<sub>2</sub>

Beil. V - 509

V<sub>1</sub>—V<sub>2</sub>-(501)

M.P. 55-56° (1) B.P. 337° at 760.5 mm. (5)  
55° (2) (3) (4) (5) 186-190° at 18 mm. (1)  
54-55° (7) 208-219° at 15 mm. (3)

Colorless ndls. from MeOH.

[For prepn. of  $\bar{C}$  from 4,4'-dichlorobenzophenone (3:1270) by reduction with conc. HI + red P in boilg. AcOH (4) or as by-prod. of reduction with Zn dust + AcOH + dil. H<sub>2</sub>SO<sub>4</sub> (5) see indic. refs.; from 4,4'-diaminodiphenylmethane [Beil. XII-238, XII<sub>1</sub>-(71)] by tetrazotization and subsequent use of Cu<sub>2</sub>Cl<sub>2</sub> reaction (59% yield) see (1).]

[For prepn. of  $\bar{C}$  from chlorobenzene (3:7903) by action of *sym*-dichloro-dimethyl ether (3:5245) in pres. of ZnCl<sub>2</sub> (3) or better (alm. 100% yield (3)) conc. H<sub>2</sub>SO<sub>4</sub> at 40°, or by action in pres. of H<sub>2</sub>SO<sub>4</sub> of various other formaldehyde derivs. (6), see indic. refs.; from *p*-chlorobenzyl chloride (3:0220) with chlorobenzene (3:7903) + conc. H<sub>2</sub>SO<sub>4</sub> (67% yield (3)) see indic. refs.]

[For prepn. of  $\bar{C}$  from "DDT" (3:3298), from 1,1-dichloro-2,2-bis-(*p*-chlorophenyl)-ethylene (3:2138), or from di-(*p*-chlorophenyl)acetic acid (3:4612) by action of KOH in ethylene glycol refluxed 8-10 hrs. (alm. 100% yield) see (2).]

[For formn. of  $\bar{C}$  (21% yield) from hydrazone of 4,4'-dichlorobenzophenone (3:4270) via Wolff-Kishner reduction see (7).]

$\bar{C}$  on oxidn. with  $\text{CrO}_3/\text{AcOH}$  readily gives (3) 4,4'-dichlorobenzophenone (3:4270), m.p. 145° (3).

$\bar{C}$  on nitration by addn. to 8 pts. fuming  $\text{HNO}_3$  ( $D = 1.5$ ) with water cooling gives (1) 3,3'-dinitro-4,4'-dichlorophenylmethane, white pl. from  $\text{AcOH}$ , m.p. 198-199° (1), 196° (3); this prod. with piperidine splits out 2 moles  $\text{HCl}$  giving (1) 3,3'-dinitro-4,4'-dipiperidinodiphenylmethane, m.p. 183-184° (1). — [Note, however, that  $\bar{C}$  dislvd. in 9-10 wt. pts. conc.  $\text{HNO}_3$  ( $D = 1.42$ ) and kept at 100° for 1 hr. (3) gives some of the above dinitro derivative but is also in part oxidized and nitrated (or vice versa) with formn. of 3,3'-dinitro-4,4'-dichlorobenzophenone, ndls. from alc., m.p. 132° (3); see also text of 4,4'-dichlorobenzophenone regarding nitration.]

3:1057 (1) LeFevre, Turner, *J. Chem. Soc.* 1927, 1120. (2) White, Sweeney, *U.S. Pub. Health Repts.* 60, 66-71 (1915). (3) Stephen, Short, Gladding, *J. Chem. Soc.* 117, 522-523 (1920).

405f

3:1058  $\beta,\beta$ -DICHLOROPROPIONIC ACID  $\text{C}_3\text{H}_4\text{O}_2\text{Cl}_2$  Beil. II -252  
 $\text{Cl}_2\text{CH}.\text{CH}_2.\text{COOH}$  II—  
 II—

M.P. 56° (1)

Colorless cryst., eas. sol. aq., alc., ether,  $\text{C}_6\text{H}_6$ , or  $\text{CHCl}_3$ .

[For prepn. of  $\bar{C}$  from  $\beta$ -chloroacrylic acid (3:2240) by addn. of 1  $\text{HCl}$  with 40% aq.  $\text{HCl}$  in s.t. at 80-85° for 35-40 hrs. (yield not stated) see (1).]

$\bar{C}$  with alc.  $\text{KOH}$  splits out 1  $\text{HCl}$  giving (1)  $\beta$ -chloroacrylic acid (3:2240).

$\bar{C}$  with  $\text{SOCl}_2$  at 75-80° for 3-4 hrs. gives (2)  $\beta,\beta$ -dichloropropionyl chloride (3:9032-A).

— Methyl  $\beta,\beta$ -dichloropropionate: unreported.

— Ethyl  $\beta,\beta$ -dichloropropionate: b.p. 171-175° (1). [From  $\bar{C}$  in  $\text{EtOH}$  with dry  $\text{HCl}$  (1).]

①  $\beta,\beta$ -Dichloropropionamide: ndls. from  $\text{CHCl}_3$ , m.p. 140° (1). [From ethyl  $\beta,\beta$ -dichloropropionate (above) with conc. aq.  $\text{NH}_4\text{OH}$  on shaking at room temp. (1).]

—  $\beta,\beta$ -Dichloropropionanilide: unreported.

—  $\beta,\beta$ -Dichloropropion-*p*-toluidide: unreported.

3:1058 (1) Otto, *Ann.* 239, 266-272 (1887). (2) Leimu, *Ber.* 70, 1050 (1937).

3:1060 2,3,5-TRICHLOROBENZALDEHYDE  $\text{C}_7\text{H}_3\text{OCl}_3$  Beil. S.N. 635

M.P. 56° (1)

Colorless ndls. (from dil. alc.) with characteristic pungent odor. — Volatile with steam.

— [Note that a patent abstract gives m.p. as 75-76° (2).]

[For prepn. of  $\bar{C}$  from 3-amino-2,5-dichlorobenzaldehyde (presumably by diazotization and use of  $\text{Cu}_2\text{Cl}_2$  reaction) see (1).]

$\bar{C}$  on oxidn. with neutral  $\text{KMnO}_4$  gives (1) 2,3,5-trichlorobenzoic acid (3:4485), m.p. 162-163°.

$\bar{C}$  with  $PCl_5$  should give 2,3,5-trichlorobenzal (di)chloride, but this compd. is unreported in the literature.

- 2,3,5-Trichlorobenzaldoxime: unreported.
- 2,3,5-Trichlorobenzaldehyde phenylhydrazone: unreported.
- 2,3,5-Trichlorobenzaldehyde *p*-nitrophenylhydrazone: unreported.
- 2,3,5-Trichlorobenzaldehyde 2,4-dinitrophenylhydrazone: unreported.

54°                  (11)

[See also 2-chlorohydroquinone (3:3130).]

Pale yel. cryst.; eas. sol. aq., alc., ether,  $\text{CHCl}_3$ . — Volatile even at ord. tem. — Gradually dec. by light (3) (for study of photochem. decompn. in alc. see (12)). — Sol. in conc.  $\text{H}_2\text{SO}_4$  on warming with brown black color.

[For prepn. of  $\bar{C}$  from 2-chlorohydroquinone (3:3130) by oxidn. with  $\text{NaClO}_3 + \text{H}_2\text{SO}_4 + \text{V}_2\text{O}_5$  in  $\text{AcOH}$  (92% yield (13)), with  $\text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$  (yield: 89% (14), 84% (1)) (7), with  $\text{MnO}_2 + \text{dil. H}_2\text{SO}_4$  (56% yield (1)), or with  $\text{PbO}_2$  in  $\text{C}_6\text{H}_6$  (2) see indic. refs.; from 2-chloro-4-aminophenol [Beil. XIII-510, XIII<sub>1</sub>-(181)] by oxidn. with  $\text{K}_2\text{Cr}_2\text{O}_7 +$

$\text{H}_2\text{SO}_4$  (68% yield (8)) (10) (15) see indie. refs.; from benzoquinone-1,4 (1:9025) in  $\text{OCl}_2$  with  $\frac{1}{2}$  mole  $\text{HCl}$  gas see (9); for formn. of  $\bar{\text{C}}$  (together with other prods.) from oxidn. of copper salt of quinic acid [Beil. X-535, X<sub>1</sub>-270] with  $\text{MnO}_2$ ,  $\text{NaCl}$  + dil.  $\text{H}_2\text{SO}_4$  see (16)]

[For use of  $\bar{\text{C}}$  as vulcanization accelerator see (17); for use as seed disinfectant see (18); for study of bactericidal action see (19).]

$\bar{\text{C}}$  on reductn. with aq.  $\text{SO}_2$  gives (16) (7) 2-chlorohydroquinone (3:3130) (note, however, that  $\bar{\text{C}}$  in dil. aq.  $\text{NaOH}$  under  $\text{N}_2$  with  $\text{SO}_2$  is in part reduced to 2-chlorohydroquinone and in part sulfonated (20)). [For studies on oxidn.-reductn. potential of system  $\bar{\text{C}}$  + 2-chlorohydroquinone (3:3130) see (1) (2) (3) (21) (22) (23) (24).] — [ $\bar{\text{C}}$  with 2-chlorohydroquinone (3:3130) yields (1) (16) (25) the corresp. quinhydrone, monohydrate, violet pr. with green shimmer, m.p. 70–72° (25), anhydrous form, m.p. 93–94° (25), 67° (1);  $\bar{\text{C}}$  with hydroquinone (1:1590) gives (25) (6) corresp. quinhydrone, dark green ndls. from alc., m.p. 132–133° (25), 130–135° (6).]

[ $\bar{\text{C}}$  in  $\text{CHCl}_3$  with  $\text{HCl}$  gas (7) (26) or  $\bar{\text{C}}$  with hot conc.  $\text{HCl}$  (83% yield (10)) gives only 2,5-dichlorohydroquinone (3:4690), but  $\bar{\text{C}}$  in ether with  $\text{HCl}$  gas (26) or  $\bar{\text{C}}$  dislvd. in cold dil.  $\text{HCl}$  ( $D = 1.10$ ) (26) gives both 2,3-dichlorohydroquinone (3:4220) and 2,5-dichlorohydroquinone (3:4690);  $\bar{\text{C}}$  refluxed with conc.  $\text{HBr}$  gives (27) 2-chloro-5-bromohydroquinone [Beil. VI-853], ndls. m.p. 171–172° (28) (diacetate, m.p. 145–146° (28));  $\bar{\text{C}}$  in alc. with  $\text{KCN}$  +  $\text{H}_2\text{SO}_4$  gives in good yield (29) 3,6-dihydroxyphthalonitrile (2,3-dicyanohydroquinone) [Beil. X-551]]

[ $\bar{\text{C}}$  with  $\text{Ac}_2\text{O}$  + trace  $\text{H}_2\text{SO}_4$  yields (29) a chloro-hydroxyhydroquinone triacetate, ndls. from alc., m.p. 96–97° (29);  $\bar{\text{C}}$  with  $\text{AcCl}$  gives (28) 2,5-dichlorohydroquinone diacetate, m.p. 141°;  $\bar{\text{C}}$  with  $\text{AcBr}$  gives (28) 2-chloro-5-bromohydroquinone diacetate, m.p. 145–146° (28)]

[ $\bar{\text{C}}$  with 2,3-dimethylbutadiene-1,3 (1:8050) gives an adduct which upon oxidn. yields (30) 2-chloro-6,7-dimethylnaphthoquinone-1,4; for reactn. of  $\bar{\text{C}}$  with diazotized aniline see (31); for addn. prods. of  $\bar{\text{C}}$  with hexamethylbenzene (1:7205) see (5).]

[ $\bar{\text{C}}$  in alc. or  $\text{AcOH}$  on warming with aniline gives (32) 2,5-dianilinoenzoquinone-1,4 [Beil. XIV-138, XIII<sub>1</sub>-(413)], red-hr. scales, m.p. 345° u.c.]

[ $\bar{\text{C}}$  in dil. alc. with  $\text{NH}_4\text{OH.HCl}$  as directed (33) gives 2-chlorobenzoquinone-1,4-monoxime-4 (purified (with difficulty) by conv. to the mixt. of stereoisomeric oxime acetates followed by hydrolysis), m.p. 142° (34), 148° dec. (35); this prod. by special treatment yields n dioxime [Beil. VII-632].]

$\bar{\text{C}}$  in cold dil. alc. with semicarbazide  $\text{HCl}$  gives (36) 2-chlorobenzoquinone-1,4-semicarbazone-4, deep yel. cryst. from acetone + pet. ether, m.p. 185° dec. (36); this prod. on hoilg. with dil. aq.  $\text{NaOH}$  yields o-chlorophenol (3:5980) +  $\text{N}_2$  +  $\text{CO}_2$  +  $\text{NH}_3$  (36);  $\bar{\text{C}}$  does not give n bis-semicarbazone (36).

See text.

Lfts. from pet. ether (5), alc. (1) (5), or ether (2), eas. sol. in org. solv. except lgr. —  
C̄ on distn. even under reduced press. loses HCl with partial conversion (2) to phenyl  
vinyl ketone; nevertheless in small amts. of less than 10 g C̄ may be distd below 2 mm (3);  
in general, however, unnecessary htg of C̄ should be avoided (4).

[For prepn. of C̄ from  $\beta$ -chloropropionyl chloride (3 5690) with  $C_6H_6$  +  $AlCl_3$  (yield:  
90% (1), 80-90% (6), 65% (5)) see indie. refs. (note, however, that this method is best  
suited for small runs (6) since with large units much  $\omega$ -benzylacetophenone [Beil. VII-444,  
VII<sub>1</sub>-(237)], m p. 72°, is also formed (6) (4); furthermore that C̄ prepd by this method  
melts at 49° even when white, unless it is treated with decolorizing carbon (3), for prepn.  
from benzoyl chloride (3:6240) + ethylene +  $AlCl_3$  (87-92% yield) in special apparatus  
see (3); for prepn. of C̄ from phenyl vinyl ketone + HCl gas in dry ether see (2); for formn.  
of C̄ from ethyl phenyl ketone (propiophenone) (1-5525) +  $Cl_2$  see (7) ]

[C̄ htd 15-30 min. in AcOH with  $1\frac{1}{2}$  moles NaOAc or KOAc, then poured into aq. and  
neutralized with  $K_2CO_3$ , gives (8)  $\beta$ -acetoxypropiophenone, lfts from MeOH, m.p. 53-54°  
(8); C̄ in hot alc. treated with KOAc, then with aq. NaCN, gives (65% yield (9))  $\beta$ -cyano-  
propiophenone, lfts. from alc., m.p. 76° (2,4-dinitrophenylhydrazone, m p. 141°; corresp.  
 $\beta$ -benzoylpropionic acid, m.p. 116° (9)) ]

[C̄ under certain circumstances reacts as potential phenyl vinyl ketone: e.g., C̄ + KOAc  
in hot MeOH treated with phenyl-nitromethane + NaOMe gives (82% yield (10)) (pro-  
sumably ]

$C_6H_6$  + p  
with desox  
1,5, m.p. 95° (monoxime, m.p. 131°; dioxime, m.p. 162°; 2,4-dinitrophenylhydrazone,  
m.p. 221°) (6) ]

C̄ in AcOH reduced with  $H_2$  + Adams cat gives (11) 3-chloro-1-phenylpropanol-1,  
b.p. 130-132° at 8 mm. (p-nitrobenzoate, m.p. 62-63°) (11).

[For study of rate of reactn. of C̄ with KI in acetone see (5), for study of C̄ with Na +  
liq  $NH_3$  see (12); for behavior of C̄ with anthrone see (13) (14) (15); for reactn of C̄ with  
 $C_6H_5MgBr$  yielding  $\omega$ -benzylacetophenone ( $\beta$ -phenylpropiophenone) (cf. above) see

$\bar{C}$  dislvd. in alc. warmed at 60° with  $\text{Na}_2\text{S} \cdot 9\text{H}_2\text{O}$  dislvd. in aq. gives (5) (73% yield (6)) bis-(*p*-methylphenacyl)sulfide, pale yel. ndls. from alc., m.p. 88° (5); 88.8–89.3° (6). [For detn. of  $\bar{C}$  by titration of residual chloride ion from this reaction see (5).]

[For reactions of  $\bar{C}$  with phenol + KOH + Cu see (7); with phenyl-*p*-bromophenyl-, *p*-nitrophenyl-, *o*-tolyl-, and *p*-tolyl-hydrazines see (5); with  $\text{Br}_2$  see (8); with KCN or KSCN see (9); with alc. NaOEt see (10).]

### 3:1145 2,5-DICHLOROBENZALDEHYDE

$\text{C}_7\text{H}_4\text{OCl}_2$

Beil. VII -237

VII—

M.P. 58° (1) B.P. 231–233° (1)  
57–58° (2) (4) 230–233° (2)  
57° (3)

Ndls. from alc. (4). — Very eas. sol. alc., ether,  $\text{CHCl}_3$ ,  $\text{C}_6\text{H}_6$ ,  $\text{CS}_2$ , AcOH (4). — Eas. volatile with steam (4). — Sol. in conc.  $\text{H}_2\text{SO}_4$  with olive-yel. color; repptd. in cryst. form on dilution (4) (8).

[For prepn. of  $\bar{C}$  from benzaldehyde (1:0195) by chlorination in presence of  $\text{SbCl}_5$  +  $\text{I}_2$  see (5) (1) (9); from 2,5-dichlorotoluene (3:6245) by chlorination to 2,5-dichlorobenzal (di)chloride (3:0490) (m.p. 42°) and hydrolysis of the latter with  $\text{CaCO}_3$  +  $\text{H}_2\text{O}$  see (1); from 5-nitro-2-chlorobenzaldehyde via reduction to 5-amino-2-chlorobenzaldehyde followed by diazotization + use of CuCl see (6).]

$\bar{C}$  with satd. aq.  $\text{NaHSO}_3$  soln. yields a cpd.,  $\bar{C} \cdot \text{NaHSO}_3$  (5), ndls. fairly eas. sol. aq. but dissociating on warming into  $\bar{C}$  + aq. (5).

$\bar{C}$  on oxidn. with  $\text{KMnO}_4$  (2) (4) yields 2,5-dichlorobenzoic ac. (3:4340), m.p. 152° (2), 152–153° (4). —  $\bar{C}$  with 50% aq. KOH (5) (1) (6) undergoes Cannizzaro reactn. giving (90% yield (6)) 2,5-dichlorobenzyl alc., cryst. from  $\text{C}_6\text{H}_6$ , m.p. 80° (1) (6), and (84% yield (7)) 2,5-dichlorobenzoic ac. (3:4340), cryst. from aq., m.p. 155° (5) (7). —  $\bar{C}$  on reductn. with 4% Na/Hg in alc. yields (1) 2,5-dichlorobenzyl alc., m.p. 80° (1).

$\bar{C}$  with  $\text{PCl}_5$  (3) gives (78% yield (3)) 2,5-dichlorobenzal (di)chloride (3:0490), b.p. 118–120° at 14 mm, m.p. 42° (8), 43° (3).

$\bar{C}$  on mononitration as specified (5) gives (100% yield (9)) a mixt. of two isomers; by recrystallization from MeOH (9) or EtOH (5) this mixt. gives (62% yield (9)) 2,5-dichloro-6-nitrobenzaldehyde, lfts. or ndls., m.p. 137° (5); the other more soluble isomer is 2,5-dichloro-3-nitrobenzaldehyde (10), m.p. 66–67° (5). [The latter yields a phenylhydrazone, or. ndls., m.p. 171°, a *p*-nitrophenylhydrazone, deep or. ndls., m.p. 290–292° dec., and on oxidn. with alk.  $\text{KMnO}_4$  yields 2,5-dichloro-3-nitrobenzoic ac., colorless ndls. from AcOH, m.p. 220° (10).]

[For conversion of  $\bar{C}$  to 2,5-dichlorostyrene (12) (13) via reaction with  $\text{MeMgX}$  giving (83% yield (12)) 2,5-dichlorophenyl-methyl-carbinol and dehydration of latter with  $\text{H}_2\text{SO}_4$  (37% yield (12)) see indic. refs.]

BINARY SYSTEMS CONTG.  $\bar{C}$ *Azotropic Systems*

$\bar{C}$  with pentachloroethane (3:5880) forms a const.-boilg. mixt., b.p. 161.8° at 760 mm., contg. 3.5 wt. %  $\bar{C}$  (25);  $\bar{C}$  with *p*-dichlorobenzene (3:0980) forms a const.-boilg. mixt., b.p. 174.0° at 760 mm., contg. about 12 wt. %  $\bar{C}$  (26);  $\bar{C}$  with *o*-bromotoluene forms a const.-boilg. mixt., b.p. 180.0° at 760 mm., contg. about 18 wt. %  $\bar{C}$  (26).]

*Other Physical Data on Binary Systems Contg.  $\bar{C}$* 

$\bar{C}$  + aq. [ $\bar{C}$  is eas. sol. aq.; for study of hydration at  $-35^\circ$  see (70) cf. (34); for f.p./compn. data see (3); for data on  $D_{20}^{20}$  (31) and  $D_{25}^{25}$  (71) of aq. solns. see indic. refs.; for  $n_D^{18}$  (8),  $n_D^{20}$  (31) cf. (73) see indic. refs.]

$\bar{C}$  +  $H_2SO_4$ . [For f.p./compn. data and diagram (no compd. formed) see (10).]

$\bar{C}$  +  $H_3PO_3$ . [For f.p./compn. data and diagram (no compd. formed) see (12).]

$\bar{C}$  + AcOH (1:1010). [For f.p./compn. data (no cpd.) (74),  $D_4^{25}$  (2), viscosity (2), and conductivity (1) see indic. refs.]

$\bar{C}$  + chloroacetic acid (3:1370). [For f.p./compn. data (74), eutectic, m.p. 17.5°, contg. 51.5 mole %  $\bar{C}$  (75), see indic. refs.]

$\bar{C}$  + dichloroacetic acid (3:6208). [For f.p./compn. data (74), eutectic, m.p.  $-11.0^\circ$ , contg. 36 mole %  $\bar{C}$  (75), see indic. refs.]

$\bar{C}$  + miscellaneous cpds. of Order 1. [For f.p./compn. data on following systems see indic. refs.]

$\bar{C}$  with hydrocarbons:  $\bar{C}$  +  $C_6H_6$  (1:7400) (5);  $\bar{C}$  + camphene (76).

$\bar{C}$  with alcohols:  $\bar{C}$  + *EtOH* (1:6130) (14);  $\bar{C}$  + *ter-BuOH* (1:6140) (14);  $\bar{C}$  + *ethyl alc.* (1:5945) (14);  $\bar{C}$  + *d-borneol* (1:5990) (14);  $\bar{C}$  + *l-menthol* (1:5940) (14);  $\bar{C}$  + *pinacol* (1:5805) (14);  $\bar{C}$  + *meso-erythritol* (1:5825) (6);  $\bar{C}$  + *d-mannitol* (1:5830) (14).

$\bar{C}$  with phenols:  $\bar{C}$  + *phenol* (1:1420) (14) (11);  $\bar{C}$  + *o-cresol* (1:1400) (11);  $\bar{C}$  + *m-cresol* (1:1730) (11);  $\bar{C}$  + *p-cresol* (1:1410) (11);  $\bar{C}$  + *guaiacol* (1:1405) (14);  $\bar{C}$  + *thymol* (1:1430) (11);  $\bar{C}$  +  $\alpha$ -*naphthol* (1:1500) (11);  $\bar{C}$  +  $\beta$ -*naphthol* (1:1540) (11);  $\bar{C}$  + *hydroquinone* (1:1590) (14).

$\bar{C}$  with aldehydes:  $\bar{C}$  + *benzaldehyde* (1:0195) (7);  $\bar{C}$  + *salicylaldehyde* (1:0205) (7);  $\bar{C}$  + *m-hydroxybenzaldehyde* (1:0055) (7);  $\bar{C}$  + *p-hydroxybenzaldehyde* (1:0060) (7);  $\bar{C}$  + *p-anisaldehyde* (1:0240) (7);  $\bar{C}$  + *vanillin* (1:0050) (7);  $\bar{C}$  + *piperalonal* (1:0010) (7).

$\bar{C}$  with ketones:  $\bar{C}$  + *acetophenone* (1:5515) (7);  $\bar{C}$  + *benzophenone* (1:5150) (7);  $\bar{C}$  + *p-methoxybenzophenone* (1:5170) (7);  $\bar{C}$  + *benzil* (1:9015) (7);  $\bar{C}$  + *dibenzalacetone* (1:9024) (7);  $\bar{C}$  + *benzoquinone-1,4* (1:9025) (7).

$\bar{C}$  with acids:  $\bar{C}$  + *acetic acid* (1:1010) (74);  $\bar{C}$  + *benzoic acid* (1:0715) (74);  $\bar{C}$  + *o-toluic acid* (1:0690) (74);  $\bar{C}$  + *m-toluic acid* (1:0705) (74);  $\bar{C}$  + *p-toluic acid* (1:0795) (74);  $\bar{C}$  + *phenylacetic acid* (1:0665) (74);  $\bar{C}$  + *cinnamic acid* (1:0735) (74);  $\bar{C}$  + *crotonic acid* (1:0425) (74).

$\bar{C}$  with esters:  $\bar{C}$  + *EtOAc* (1:3015) (5);  $\bar{C}$  +  $\alpha$ -*naphthyl acetate* (1:2124) (5);  $\bar{C}$  +  $\beta$ -*naphthyl acetate* (1:2273) (5);  $\bar{C}$  + *methyl benzoate* (1:3586) (5);  $\bar{C}$  + *ethyl benzoate* (1:3721) (5);  $\bar{C}$  + *benzyl benzoate* (1:4422) (5);  $\bar{C}$  + *phenyl benzoate* (1:2257) (5);  $\bar{C}$  + *methyl cinnamate* (1:2090) (5);  $\bar{C}$  + *phenyl salicylate* ("Salol") (1:1415) (5); various others (5).

$\bar{C}$  with ethers:  $\bar{C}$  + *diethyl ether* (1:6110) (77);  $\bar{C}$  + *reratrole* (1:7560) (14).

$\bar{C}$  + compounds of Order 2.  $\bar{C}$  + *o-nitrophenol* (11);  $\bar{C}$  + *m-nitrophenol* (11);  $\bar{C}$  + *p-nitrophenol* (11);  $\bar{C}$  + *o-nitrobenzaldehyde* (7);  $\bar{C}$  + *m-nitrobenzaldehyde* (7);  $\bar{C}$  + *p-nitrobenzaldehyde* (7);  $\bar{C}$  + *nitropiperalonal* (7);  $\bar{C}$  + *azobenzene* (78);  $\bar{C}$  + *ethyl carbamate* (urethane) (16);  $\bar{C}$  + *urea* (78A).

BIOCHEMICAL ASPECTS OF  $\bar{C}$ 

[For study of toxicity of  $\bar{C}$  see (79); for study of bactericidal effect see (80) (81).]

PREPARATION OF  $\bar{C}$ 

From chloral (anhydrous). [For prepn. of  $\bar{C}$  from chloral (3:5210) by oxidn. with fung.  $\text{HNO}_3$  (82) (83) (84), with  $\text{HNO}_2$  (85), with  $\text{NO}_2$  at 40–60° (70% yield (86)), or with aq. chlorates + cat. see (312); for formn. of  $\bar{C}$  from chloral as by prod. of oxidn. with  $\text{O}_2$  see (23).]

From chloral hydrate. [For prepn. of  $\bar{C}$  from chloral hydrate (3:1270) by oxidn. with fung.  $\text{HNO}_3$  (63% yield (82)) (85), with  $\text{KMnO}_4$  (88), with  $\text{KClO}_3$  (89), with  $\text{Ca}(\text{OCl})_2$  (15), or with aq. chlorates + cat. (312) see indic. refs.]

From acetic acid. [For formn. (first discovery) of  $\bar{C}$  from acetic acid (1:1010) by chlorination with  $\text{Cl}_2$  in sunlight see (90).]

From tetrachloroethylene. [For formn. of  $\bar{C}$  from tetrachloroethylene (3:5460) by stdg. in aq. in light for 4 months see (91) cf. (92); for many other methods see text of tetrachloroethylene (3:5460) under oxidation.]

From miscellaneous sources. [For formn. of  $\bar{C}$  from pentachloroethyl chloroformate (Beil. III-13, III-1(6)) with aq. on htg. (93), but yield is small (94) owing to other modes of reaction (94); from pentachloroethyl trichloroacetate (Beil. II-210) with aq. (95); from trichloroacetyl chloride (3:5420) (96) or from trichloroacetic acid anhydride (3:6575) (97) (98) with aq.; from  $\beta,\beta,\beta$ -trichloroethyl alcohol (3:5775) by oxidn. with fung.  $\text{HNO}_3$  (210), see indic. refs.]

CHEMICAL BEHAVIOR OF  $\bar{C}$ PYROLYSIS OF  $\bar{C}$ 

(See also below under decarboxylation.) Pure  $\bar{C}$  shows no tendency to decompose at its b.p. (99). — [However,  $\bar{C}$  in presence of pumice begins to decompose about 180° giving (99)  $\text{HCl}$ ,  $\text{COCl}_2$  (3:5000),  $\text{CO} + \text{CO}_2$ . —  $\bar{C}$  in presence of  $\text{ThO}_2$  begins to decompose at 160–165° giving (99) the same products, although  $\bar{C}$  in presence of  $\text{ThO}_2$  above 210° (100) or in presence of kaolin above 230° (100) gives  $\text{CHCl}_3$  (3:5050), tetrachloroethylene (3:5460), hexachloroethane (3:4835),  $\text{HCl}$ ,  $\text{CO} + \text{CO}_2$ . —  $\bar{C}$  in presence of animal charcoal at 135° gives (99)  $\text{CHCl}_3$  (3:5050) +  $\text{CO}_2$ , but at 200–300° these are accompanied (100) by a little tetrachloroethylene (3:5460), hexachloroethane (3:4835),  $\text{HCl}$ , and  $\text{CO}$ . —  $\bar{C}$  at 300° in s.t. for 4 hrs. gives (101) trichloroacetyl chloride (3:5420),  $\text{CO}$ ,  $\text{CO}_2$  +  $\text{HCl}$ .]

REDUCTION OF  $\bar{C}$ 

[ $\bar{C}$  on partial reduction with  $\text{Zn} + \text{aq.}$  (102), with  $\text{Cu}$  powdr. in aq. (103), with  $\text{Cu}$  powdr. in  $\text{C}_6\text{H}_6$  + aniline (104) cf. (105), or  $\bar{C}$  on electrolytic reduction (106) gives (yields: 80% (103) (106), 75–85% (104)) dichloroacetic acid (3:6208).]

[ $\bar{C}$  on complete reduction with  $\text{HI}$  at 100° (87), or in aq. soln. with  $\text{K/Hg}$  (107) (84), or by electrolytic reduction with  $\text{Pt}$ ,  $\text{Cu}$ , or  $\text{Pb}$  electrodes (108) gives acetic acid (1:1010).]

[ $\bar{C}$  in aq. alc.  $\text{KOH}$  with  $\text{H}_2/\text{Pd}$  gives up all its chlorine as  $\text{HCl}$  (109) presumably yielding  $\text{AcOH}$  (1:1010).]

REACTIONS INVOLVING THE  $-\text{COOH}$  GROUP OF  $\bar{C}$ Decarboxylation of  $\bar{C}$ 

$\bar{C}$  in aq., in aq. alkalis, or in aniline or other organic bases undergoes cleavage into  $\text{CHCl}_3$  (3:5050) +  $\text{CO}_2$ ; for this decompn. presence of the trichloroacetate ion appears

necessary since in relatively nonbasic solvents it does not occur [e.g.,  $\bar{C}$  does not decompose at 25° in  $C_6H_6$  (110), toluene (111),  $CHCl_3$  (110) (111),  $CCl_4$  (110),  $CS_2$  (110), isoamyl alc. (117), acetone (110), ether (110), ethyl acetate (117), ethyl benzoate (110), acetic acid (117), nitrobenzene (110), or 6 *N*  $H_2SO_4$  (117); in MeOH (111) and in EtOH (111) (112) the only reaction is esterification (see below)].

The decompn. of  $\bar{C}$  into  $CHCl_3 + CO_2$  by boiling with nq. or nq. alk. has long been known (90) (113) (114) (115), and KCN behaves similarly (116). — [For studies on kinetics of decompn. of  $\bar{C}$  in aq. at various temps. see (4) (118) (119) (103) cf. (120); note that rate of decompn. is catalyzed by light (111) (119) (121) (122). — For studies of decompn. of aq. solns. of various salts (117) (123) (124) (125) and influence of light (126) (127) or of presence of various other inorganic salts (128) see indic. refs. — For studies of decompn. of  $\bar{C}$  in aqueous dioxane see (129). — Note that  $\bar{C}$  with  $Ca(OH)_2$  on htg. gives  $CHCl_3$  and that this reaction has been patented (134).]

[For study of decompn. of  $\bar{C}$  in aniline (117) (111) (130) (131) including influence of supersonic waves (132) see indic. refs.; for decompn. of  $\bar{C}$  in tertiary bases such as dimethylaniline see (133) but note in  $\bar{C}$  does not decompose in pyridine (111).]

[ $\bar{C}$  on htg. in resorcinol or cresol gives (135)  $CHCl_3 + CO_2$ , but  $\bar{C}$  on htg. in phenol or thymol decomposes differently yielding (135) (136) phosgene (3:5000) +  $HCl + CO$ .]

[Note that, as a consequence of the decompn. of  $\bar{C}$  into  $CHCl_3 + CO_2$ , it has been employed in Reimer-Tiemann types of condensation: e.g.,  $\bar{C}$  with phenol + aq. NaOH gives *o*-hydroxybenzaldehyde (1:0205) + *p*-hydroxybenzaldehyde (1:0060) (137) (138); many other phenols have also been studied (137) (138).]

### Acid Strength of $\bar{C}$

$\bar{C}$  in aq. soln. behaves as an exceedingly strong monobasic acid; Neut. Eq. = 163.4 (found 164.6 (91)). — [Ionization constant of  $\bar{C}$  in nq. soln. at 25° is about 1.2 (139) cf. (140), but because of strength of  $\bar{C}$  and its tendency to decompn. (see above) no accurate value is available (143). — For discussion of resonance and acid strength of  $\bar{C}$  see (141) (142) (143). — For studies of electrical conductivity of  $\bar{C}$  in aq. solns. at various temps. see (144) (145) (146) (147) (30).]

[Studies of acid strength of  $\bar{C}$  in nonaqueous solvents include the following: in EtOH (148) (149), in *n*-BuOH (150) (13), in ether (151), in  $CHCl_3$  (151), in formamide (152), in  $C_6H_6$  (153), in chlorobenzene (154), or in dioxane (155). — For study of electrometric titration of  $\bar{C}$  in  $C_6H_6$  (156), in ethylene glycol monomethyl ether ("methylcellosolve") (157), in anisole-*n* butyl alc. (157), see indic. refs. — For titration of  $\bar{C}$  in  $Ac_2O$  soln. with NaOAc see (158) cf. (310). — For study of behavior of  $\bar{C}$  with indicators in  $C_6H_6$  soln. see (159) (160).]

### Catalytic Effect of $\bar{C}$ on Various Reactions

The catalytic influence of  $\bar{C}$  upon diversified types of chem. reactions has been extensively examined; although this matter cannot be recorded exhaustively, the following examples are cited.

[For studies on catalytic effect of  $\bar{C}$  upon the inversion of *l*-menthone to *d*-isomenthone in  $C_6H_6$  (161) (162) or in chlorobenzene (163); upon racemization of methyl-phenyl-acetophenone and of isobutyl-phenyl-acetophenone in various solvents (164); of isopulegone to pulegone in nonaqueous solvents (165); or on hydrogen disproportionation of *d*-limonene (311), see indic. refs.]

[For studies of catalytic effect of  $\bar{C}$  upon the hydrolysis of EtOAc (144) or of sucrose (166) (167) see indic. refs.]

[For studies of catalytic effect of  $\bar{C}$  upon formn. of ether from EtOH (168); upon rate

of esterification of various org. acids in MeOH (159) or in EtOH (170); upon nitration of toluene (171) cf. (172); upon decompn. of ethyl diazoacetate in  $C_6H_6$  (162) or other solvents (173) (174) (175); upon decompn. of nitramide in iso-AmOH (176); upon rearr. of *N*-chloroacetanilide (177); upon rearr. of *N*-bromoacetanilide in chlorobenzene (178) (179) or in other solvents (179); upon rearr. of *N*-bromobenzanilide in chlorobenzene (180), upon chromate or perchlorate oxidn. of EtOH (181); upon addition of HBr to 3-methylbutene-1 (182), see indic. refs.

### Salts of $\tilde{C}$

This topic cannot here be treated exhaustively but the following examples are cited.

Salts with inorganic bases.  $[NH_4\tilde{A}]$ , prepn. (183),  $NH_4\tilde{A} \cdot \tilde{C}$  (184) (185);  $2NH_4\tilde{A} \cdot 5H_2O$  (186). — Hydroxylamine salt,  $HONH_2\tilde{A}$ , cryst. from dry ether by pptn. with lgr., m.p. 133–134° (187).]

$[Li\tilde{A}]$ ,  $n_D^{20}$  of aq. solns. (8), nonhygroscopic cpds. with betaine or pyridine betaine (188);  $Li\tilde{A} \cdot 2H_2O$  (189), conductivity of aq. solns (190). —  $Na\tilde{A}$  (198), effect of dry distillation (191), conductivity in aq. (190) (192), in dry MeOH (193), in dry EtOH (194);  $n_D^{20}$  of aq. solns. (8);  $Na\tilde{A} \cdot 3H_2O$  (196). —  $K\tilde{A} \cdot H_2O$  (189) (198), solubility and decompn. (197);  $K\tilde{A} \cdot \tilde{C}$  (184) (185).]

$[Ag\tilde{A}]$ , spar. sol. aq., darkens in air; on dry htg. decomposes above 80° (190) yielding (198)  $AgCl$ ,  $CO$ ,  $CO_2$ , and trichloroacetic acid anhydride (3 6575); with boilg. aq.  $Ag\tilde{A}$  yields (198)  $AgCl$ ,  $CO$ ,  $CO_2$ ,  $CHCl_3$  (3:5050), and  $\tilde{C}$ , for behavior of  $Ag\tilde{A}$  with  $I_2$  in  $C_6H_6$  see (200). —  $Hg\tilde{A}$ , ndls. from aq. in which it is spar. sol. (201) (202) (203) (209) (note that it is soluble in  $C_6H_6$  (202)). —  $Hg\tilde{A}_2$ , attempts to prepare this mercuric salt have been unsuccessful (201) (204); aq. solns. of  $\tilde{C}$  react with  $HgO$  long after theoretical amt. has been used (201), and  $CO$ ,  $CO_2$ , and  $CHCl_3$  are also formed (205).]

$[Mg\tilde{A} \cdot 4H_2O]$  (189). —  $Ca\tilde{A} \cdot 6H_2O$  (196);  $Ca\tilde{A}_2 \cdot 3\frac{1}{2}H_2O$ , eas. sol. (198). —  $Str\tilde{A}_2 \cdot 6H_2O$  (196). —  $Ba\tilde{A}_2 \cdot 6H_2O$  (196);  $Ba\tilde{A}_2 \cdot 2H_2O$  (206). —  $Be\tilde{A}_2 \cdot 2H_2O$  (207) (206). —  $Cd\tilde{A}_2$  (208);  $Cd\tilde{A}_2 \cdot 1\frac{1}{2}H_2O$  (217). —  $Zn\tilde{A}_2 \cdot 6H_2O$  (209). —  $Pb\tilde{A}_2 \cdot \frac{1}{2}H_2O$  (210);  $Ph\tilde{A}_2 \cdot H_2O$  (83). —  $Cu\tilde{A}_2 \cdot 6H_2O$  (83) (could not be confirmed (201) (211)),  $Cu\tilde{A}_2 \cdot 4H_2O$  (211);  $Cu\tilde{A}_2 \cdot 3H_2O$  (201) (complexes with benzylamine (212));  $Cu\tilde{A}_2 \cdot 2H_2O$  (complexes with various amines (213));  $Cu\tilde{A}_2$  (201) (complexes with various amines (213) (214)), electrolysis (215), electrometric titration (216).]

$[Mn\tilde{A}_2 \cdot 3\frac{1}{2}H_2O]$  (217). —  $Co\tilde{A}_2 \cdot 4H_2O$  (218) (complexes with various amines (218) (219));  $Co\tilde{A}_2 \cdot 3\frac{1}{2}H_2O$  (217). —  $Ni\tilde{A}_2 \cdot 4H_2O$  (189) (218) (complexes with  $NH_3$  (211) and various amines (220)).]

Salts with organic bases. [*Aniline trichloroacetate*, from  $\tilde{C}$  (1 mole) + aniline (1 mole) in  $C_6H_6$  (223) (224), or without solvent (225), or in aq. (226); this salt has no true m.p. (224) although various values ranging from 145° (226) to 163° (225) have been reported. — Note that, although action of heat would be expected to cause loss of  $H_2O$  giving  $\omega,\omega,\omega$ -trichloroacetanilide (see below), no actual study has been reported. — Note that  $\tilde{C}$  + aniline + Cu powder in  $C_6H_6$  soln. gives dichloroacetic acid (3 6208) (75–85% yield (223) cf. (227)). — Note finally the existence of an acid salt of  $\tilde{C}$  with aniline, m.p. 107–108° (221), from  $\tilde{C}$  (2 moles) with aniline (1 mole). — *o*-Toluidine trichloroacetate; the prepn. of this salt, m.p. 167–168° dec. (225), has been claimed (225) but could not be confirmed (221) (225); no other record of it can be found. — *p*-Toluidine trichloroacetate; the prepn. of this salt, m.p. 135° dec. (225), has been claimed (225) but could not be confirmed (221) (225); no other record of it can be found. — *N*-Methylaniline trichloroacetate; m.p. 97° (225).]

*o*-Phenylethylamine trichloroacetate: unreported. — Benzylamine trichloroacetate: from  $\tilde{C}$  + benzylamine in EtOAc, m.p. 118.8–119.5° u c, 120.3–121.3° cor. (229) (note that this

m.p. is practically identical with corresp. benzylamine salt of chloroacetic acid (3:1370) q.v.). — *Piperazine bis-(trichloroacetate)*, m.p. 121.0–121.5° car. (230). — *Semicarbazide trichloroacetate*: m.p. 154° dec. (231).

[*Phenylhydrazine trichloroacetate*: from  $\bar{C}$  with phenylhydrazine in  $C_6H_6$ , m.p. 123° (232). (Note that this product is definitely the salt since on titration with alk. it gives Neut. Eq. 204.7 as against a calcd. value of 202.6 (232); this salt upon htg. would be expected to lose  $H_2O$  giving trichloroacetophenylhydrazide, but this product is unreported.)]

[For salts of  $\bar{C}$  with *o*-, *m*-, and *p*-phenylenediamines see (233).]

### Behavior of $\bar{C}$ with Metals

[ $\bar{C}$  with aq. + Zn wool (102), or  $\bar{C}$  with Cu powder in aq. or  $C_6H_6$  (223) (103) (227), gives dichloroacetic acid (3:6208) q.v. —  $\bar{C}$  in conc.  $NH_4OH$  dissolves Cu, Zn, or Cd with strong evolu. of  $H_2$  but does not attack Ag (234)]

### Esterification of $\bar{C}$

This book includes the following esters of  $\bar{C}$  under their own individual numbers, q.v.: *methyl trichloroacetate* (3:5500), *ethyl trichloroacetate* (3:5950), *n-propyl trichloroacetate* (3:6135), *isopropyl trichloroacetate* (3:5975), *n-butyl trichloroacetate* (3:6315), *isobutyl trichloroacetate* (3:6140), *sec-butyl trichloroacetate* (3:9372), *ter-butyl trichloroacetate* (3:0138), *n-amyl trichloroacetate* (3:6560), *isoamyl trichloroacetate* (3:6400), *ter-amyl trichloroacetate* (3:6185), *trichloromethyl trichloroacetate* (3:0290),  *$\beta$ -chloroethyl trichloroacetate* (3:6510), and  *$\beta$ -methoxyethyl trichloroacetate* (3:9250).

[For studies on esterification of  $\bar{C}$  under various conditions with MeOH (1:6120) (235) (236), with EtOH (1:6130) (235) (237) (238) (239) (240) (241) (242) (243) (244) (20), with *n*-propyl alc. (1:6150) (245), with isopropyl alc. (1:6135) (245) (240) (238), with *n*-butyl alc. (1:6180) (247) (248), with isobutyl alc. (1:6165) (247) (248) (83), with *sec*-butyl alc. (1:6155) (247), with *ter*-butyl alc. (1:6140) (238), with *n*-amyl alc. (1:6205) (248), with pentanol-2 (1:6185) (248), with pentanol-3 (1:6175) (248), with *ter*-amyl alc. (1:6160) (248), with neopentyl alc. (1:5812) (249), with methyl-vinyl-carbinol (250), with benzyl alc. (1:6480) (238) (251), with diphenylcarbinol (1:5960) (238), with triphenylcarbinol (1:5985) (238), see indic. refs.]

[For study of equilibrium of transesterification with MeOAc (1:3005) or with EtOAc (1:3015) at 30° see (21).]

### Addition Reactions of $\bar{C}$ with Organic Compounds

**Addition to unsaturated linkages.**  $\bar{C}$  in pres. of suitable catalysts adds to unsatd. linkages giving the corresp. esters [e.g.,  $\bar{C}$  with propylene +  $BF_3$  gives (48.8% yield (246)) isopropyl trichloroacetate (3:5975);  $\bar{C}$  with trimethylethylene (2-methylbutene-2) (1:8220) gives both *ter*-amyl trichloroacetate (3:6185) and methyl-isopropyl-carbinyl trichloroacetate (for extensive studies of this reaction see (252) (253) (254) (255) (256) (257) (258) (259) (260))].

[ $\bar{C}$  with acetylene +  $HgSO_4$  at 60–80° gives (261) vinyl trichloroacetate [Beil. II-(94)], b.p. 149° at 760 mm.]

**Addition to epoxy compounds.** [ $\bar{C}$  with ethylene oxide (1:6105) in cold gives (28% yield (262)) (263) (264) ethylene glycol (mono)trichloroacetate ( $\beta$ -hydroxyethyl trichloroacetate) (3:9099). — For behavior of  $\bar{C}$  with 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358) see (264).]

• Conversion of  $\bar{C}$  to Corresponding Acid Halides

[The corresponding trichloroacetyl fluoride is unreported.]

[ $\bar{C}$  with  $PCl_3$  (266) (268) (269), with  $PCl_2 + ZnCl_2$  (25% yield (270)), with  $SOCl_2$  (yield 12% (270), 30% (271)) in  $C_6H_6$  (60% yield (272)) or in pyridine (90% yield (273)), with  $P_2O_5 + HCl$  gas (274), with benzotrichloride (3:6340) +  $ZnCl_2$  at  $100^\circ$  (77% yield (275)), or with benzoyl chloride (3:6240) (51–56% yield (276)) gives trichloroacetyl chloride (3:5420). — Note also that  $\bar{C}$  on pyrolysis at  $300^\circ$  decomposes (100) with formn. of  $CO_2 + CO_2 +$  trichloroacetyl chloride (3:5420) +  $HCl$ .]

[ $\bar{C}$  with  $PBr_3$  gives (265) (266) trichloroacetyl bromide, b.p.  $143^\circ$  (266),  $139.5\text{--}140^\circ$  (265); this product is also obt'd. from trichloroacetyl chloride (3:5420) with  $HBr$  gas at  $-5^\circ$  (70% yield (267)).]

[ $\bar{C}$  with  $PI_3$  (266) (or better trichloroacetyl chloride (3:5420) with  $HI$  at  $-5^\circ$  (277)) gives (71.5% yield (277)) trichloroacetyl iodide, b.p.  $74.0\text{--}74.2^\circ$  at 30 mm. (277).]

Conversion of  $\bar{C}$  to Corresponding Anhydride

[ $\bar{C}$  with  $P_2O_5$  at  $200\text{--}215^\circ$  (278) (279), or  $Na\bar{A}$  with  $SO_2Cl_2$  (or  $SO_2 + Cl_2$ ) in  $EtOAc$  (280), or  $\bar{C}$  with trichloroacetyl chloride (3:5420) and  $PCl_3$  (281),  $P_2O_5$  (282), or  $AlCl_3$  (283) gives (yields: 90–95% (280), 80% (278)) trichloroacetic acid anhydride (3:6575).]

Ⓐ Color test with  $NH_4OH/Cu_2Cl_2$  reagent.  $\bar{C}$  on shaking in filled stoppered bottle with conc. aq.  $NH_4OH$  contg.  $Cu_2Cl_2$  gives dark blue color instantly (284); note, however, that very similar behavior is shown by dichloroacetic acid (3:6208).

— Methyl trichloroacetate: oil, b.p.  $153^\circ$  (see 3:5800).

— Ethyl trichloroacetate: oil, b.p.  $167^\circ$  (see 3:5950).

— Phenyl trichloroacetate: oil, b.p.  $254\text{--}255^\circ$  dec. (135). [From trichloroacetyl chloride (3:5420) with sodium phenolate in pet. ether (135).] [Note that the isomeric 4-(trichloroacetyl)phenol, m.p.  $99.0\text{--}99.5^\circ$  has been prep'd. indirectly from trichloroacetonitrile + phenol +  $AlCl_3$  (285).]

— o-Tolyl trichloroacetate: unreported [Note, however, that the isomeric 4-(trichloroacetyl)-2-methylphenol, m.p.  $90\text{--}91^\circ$ , has been obt'd. indirectly (285).]

— m-Tolyl trichloroacetate: unreported. [Note, however, that both the isomers, viz., 4-(trichloroacetyl)-3-methylphenol, m.p.  $83\text{--}87^\circ$ , and 6-(trichloroacetyl)-3-methylphenol, oil, have been obt'd. indirectly (285).]

— p-Tolyl trichloroacetate: m.p.  $68\text{--}69^\circ$  (285). [Obtd. only by indirect means (285).]

— Benzyl trichloroacetate: oil, b.p.  $178.5^\circ$  at 50 mm (286),  $148\text{--}149^\circ$  at 15 mm. (264),  $D_4^{25} = 1.3887$  (286),  $n_D^{18} = 1.5288$  (286). [From  $\bar{C}$  with benzyl alc. (1:6480) +  $HCl$  gas at  $100^\circ$  (286), or from trichloroacetyl chloride (3:5420) with benzyl alc (1:6480).]

— p-Nitrobenzyl trichloroacetate: m.p. about  $80^\circ$  cf. (287). [Unsuitable as Ⓐ (287).]

— Phenacyl trichloroacetate: unreported.

— p-Chlorophenacyl trichloroacetate: unreported.

— p-Bromophenacyl trichloroacetate: unreported.

— p-Iodophenacyl trichloroacetate: unreported.

— p-Phenylphenacyl trichloroacetate: unreported.

Ⓐ S-Benzylthiuronium trichloroacetate: m.p.  $148\text{--}149^\circ$  (288). [Note that for corresp. salts from chloroacetic acid (3:1370) and from dichloroacetic acid (3:6208) m.p. values are respectively  $159\text{--}160^\circ$  and  $178\text{--}179^\circ$  (288).]

Ⓐ S-(p-Chlorobenzyl)thiuronium trichloroacetate: m.p.  $148^\circ$  cor. (289). (From  $\bar{C}$  (as  $Na\bar{A}$ ) with S-(p-chlorobenzyl)thiuronium chloride (289) (m.p.  $197^\circ$ ) in alc. (289); note that corresp. deriv. of chloroacetic acid (3:1370) has m.p.  $158^\circ$  cor. (289).]

## 3:1160 2,3,6-TRICHLOROPHENOL

Beil. VI - 190

VI<sub>r</sub>—VI<sub>r</sub>—(180)

M.P. 58° (1) (2)

B.P. 252-253° u.c. (5)

55° (4)

248.5-249.5° (6)

53-54° (5) (6)

Ndls. (from alc.) with intense and persistent phenolic odor. — Somewhat sol. in hot aq.; volatile with steam. — Eas. sol. alc., ether, lgr., AcOH; sol. hot  $C_6H_6$  but ppts. on cooling.

[For prepn. from 2,3,6-trichloro-4-aminophenol via diazo reactn. see (3).]

$\bar{C}$  is strongly acidic; iocization const. at 25° is  $7.3 \times 10^{-7}$  (2);  $\bar{C}$  dissolves in  $Na_2CO_3$  or NaOH (5);  $\bar{C}$  can be titrated with  $N/10$  alk.; Neut. Eq. = 197.5 (1) (4).

$\bar{C}$  in AcOH, treated with 1.4 moles  $Br_2$ , poured into aq. yields 4-bromo-2,3,6-trichlorophenol, ndls. from AcOH, m.p. 80° (3). [The methyl ether of this prod. has m.p. 69-70°; the benzoate, m.p. 110° (3).]

$\bar{C}$  treated with 1.5 moles  $Br_2$  without solvent yields (3) 4,5-dibromo-2,3,6-trichlorophenol, ndls. from dil. AcOH, m.p. 205° (3). [The methyl ether of this prod. has m.p. 130°; the benzoate, m.p. 153° (3).]

$\bar{C}$  treated with  $(CH_3)_2SO_4$  + 20% KOH at 100° for an hour yields its own methyl ether, 2,3,6-trichloroanisole, h.p. 227-229° at 756 mm.; pr. from alc., m.p. 45° (3).

Ⓢ 2,3,6-Trichlorophenyl benzoate: from  $\bar{C}$  +  $BzCl$  + 10% KOH; cryst. from pet. ether/lgr., m.p. 92-93° (3); from alc., m.p. 90° (4).

## 3:1175 2,3-DICHLOROPHENOL

Beil. VI —

VI<sub>r</sub>—(102)VI<sub>r</sub>—

M.P. 58° (1)

B.P. 206° (1)

56-57° (2) (3)

Cryst. (from pet. eth. (3)). —  $\bar{C}$  mixed with 2,5-dichlorophenol (3:1190), m.p. 57°, depresses m.p. (2). —  $\bar{C}$  is extraordinarily volatile; if dried in vac. this leads to substantial

losses; the volatility and intense odor of  $\bar{C}$  differentiate this dichlorophenol from its isomerides (2). — Odor resembles that of *o*-chlorophenol and iodoform (3). —  $\bar{C}$  is volatile with steam (3).

[For prepn. from 3-amino-2-chlorophenol via Sandmeyer method see (2) (4); from 2,3-dichloroaniline via diazo reaction see (3); from barium 2,3-dichlorophenol-4,6-disulfonate by hydrolysis of sulfonic acid groups with steam (70% yield) see (1).]

[For data on dissociation constant see (5).]

$\bar{C}$  on direct bromination (1) yields 4,6-dibromo-2,3-dichlorophenol, colorless ndls. (rapidly becoming opaque) from AcOH (1), or colorless feathery ndls. from alc. (4), m p. 90° (1) (4). [The methyl ether of this product, 4,6-dibromo-2,3-dichloroanisole, long needle-like pr. from alc., has m.p. 82° (1).]

$\bar{C}$  dislvd. in aq. NaOH and shaken with  $(CH_3)_2SO_4$  yields (3) the methyl ether, 2,3-dichloroanisole, m.p. 31° (3).

3:1175 (1) Hodgson, Kershaw, *J. Chem. Soc.* 1930, 1423. (2) Henley, Turner, *J. Chem. Soc.* 1930, 940. (3) Holleman, *Rec. trav. chim.* 37, 101-104 (1918). (4) Hodgson, Smith, *J. Chem. Soc.* 1931, 2271. (5) Murray, Gordon, *J. Am. Chem. Soc.* 57, 110-111 (1935).

### 3:1190 2,5-DICHLOROPHENOL

$C_6H_4OCl_2$

Beil. VI - 189

VI<sub>1</sub>-(103)

VI<sub>2</sub>-(178)

M.P. 58° (1) (2) (3) (4)  
59° (5)

B.P. 211° at 744 mm. (1) (4)  
94° at 14 mm. (3)

Cryst with strong and persistent phenolic odor. — Spar. sol. aq., eas. sol. alc., ether,  $C_6H_6$  — Volatile with steam.

[For prepn. from 2,5-dichloroaniline [Beil. XII-625] via diazo reaction (90% yield (1); 86% yield (6); 70% yield (5)) see (1) (6) (5) (2); from 1,2,4-trichlorobenzene + NaOCH<sub>3</sub> in MeOH at 180° see (7) ]

$\bar{C}$  in dil. alc. reddens blue litmus, dec. on boilg. with Na<sub>2</sub>CO<sub>3</sub>. Gives only faint color with FeCl<sub>3</sub> (1). [For study of ionization const. see (11) ]

$\bar{C}$  dislvd. in 3 pts. CHCl<sub>3</sub> and shaken with conc. HNO<sub>3</sub> gives on cooling CHCl<sub>3</sub> 80% yield of 2,5-dichloro-4-nitrophenol [Beil. VI-241], colorless ndls. from pet ether, m p. 117° (8). [Further nitration yields 2,5-dichloro-4,6-dinitrophenol, yel. pr. m p. 146° (8).] —  $\bar{C}$  htd. with conc. H<sub>2</sub>SO<sub>4</sub> + fumg. H<sub>2</sub>SO<sub>4</sub>, then nitrated as specified (9), yields 2,5-dichloro-6-nitrophenol, volatile with steam, yel. pr. from pet. eth., m p. 70° (9).

$\bar{C}$  in AcOH treated with 2 moles Br<sub>2</sub>, poured into nq., gives (100% yield (6)) 2,5-dichloro-4,6-dibromophenol, ndls. from dil. AcOH, m.p. 100.5° (6), 99-100° (10). [This dibromo compd. results also from  $\bar{C}$  in AcOH + NaOAc + 1 mole Br<sub>2</sub> on htg. at 100° (10).] [ $\bar{C}$  with Fe + excess Br<sub>2</sub> gives (100% yield (6)) 2,5-dichloro-3,4,5-tribromophenol, ndls. from AcOH, m p. 206° (6).]

$\bar{C}$  dislvd. in KOH and shaken with  $(CH_3)_2SO_4$  yields the methyl ether, 2,5-dichloroanisole, b p 225-227° u c. at 752 mm. (6), b p. 140° at 40 mm. (2), m p. 24° (5) (2).

③ 2,5-Dichlorophenyl benzoate: from  $\bar{C}$  + aq. KOH + BzCl, ndls. from 96% alc., m p. 69° (6).

3:1190 (1) Noeltling, Kopp, *Ber.* 38, 3510 (1905). (2) Holleman, *Rec. trav. chim.* 37, 101-104 (1918). (3) Kohlrausch, Stockmair, Ypsilanti, *Monatsh.* 67, 90 (1936). ### 3:1200 2,4,6-TRICHLOROBENZALDEHYDE

M.P. 58-50° (1) (2)

Cryst. from lgr.

[For prepn. of  $\bar{C}$  from 2,4,6-trichlorobenzal (di)chloride (3:0142) by hydrolysis with fung.  $H_2SO_4$  (94% yield) see (1); for prepn. of  $\bar{C}$  from 4-amino-2,6-dichlorobenzaldehyde by diazotization and use of  $Cu_2Cl_2$  reaction see (1).]

[ $\bar{C}$  on oxidn. with  $KMnO_4$  should yield 2,4,6-trichlorobenzoic acid (3:4545), m.p. 164°, but this reaction is not actually reported in the literature.]

$\bar{C}$  with 50% aq.  $KOH$  or 50% aq.  $NaOH$  at 100° undergoes cleavage of the aldehyde group giving (yields: 89% and 74% respectively) 1,3,5-trichlorobenzene (3:1400), m.p. 63°, accompanied by the corresp. potassium formate (1).

[ $\bar{C}$  with  $MeMgI$  in dry ether, followed by usual hydrolysis, gives (93% yield (3)) methyl-2,4,6-trichlorophenyl-carbinol, ndls. from lgr., m.p. 76.5°, b.p. 158-163° cor. at 17 mm.]

— 2,4,6-Trichlorobenzaldehyde: unreported.

— 2,4,6-Trichlorobenzaldehyde phenylhydrazone: unreported.

— 2,4,6-Trichlorobenzaldehyde *p*-nitrophenylhydrazone: unreported.

— 2,4,6-Trichlorobenzaldehyde 2,4-dinitrophenylhydrazone: unreported.

3:1200 (1) Lock, *Ber.* 66, 1532 (1933). (2) Geigy & Co. Ger. 199,943, July 4, 1908; *Cent.* 1903, II 303-304; [*C.A.* 2, 3000 (1908)]. (3) Lock, Böck, *Ber.* 70, 924 (1937).

### 3:1205 2,4-DICHLORO-3-METHYLPHENOL (2,4-Dichloro-*m*-cresol.)

M.P. 58-59° (1) B.P. 235-236° at 745 mm. (2)

58° (2) 234° (1)

75-80° at 4 mm. (1)

Note that the products of m.p. 44° (3), 45° (4), and 46° (5) formerly supposed to have been  $\bar{C}$  are now regarded (1) as 2,4,6-trichloro-3-methylphenol (3:0618).

[For prepn. of  $\bar{C}$  from 2-chloro-3-methylphenol (3:1055) or from 4-chloro-3-methylphenol (3:1535) in cold  $CHCl_3$  with  $Cl_2$  see (1); from 3-methylphenol (*m*-cresol) (1:1730) in  $CHCl_3$  with 2 moles  $Cl_2$  (other isomers are also formed) see (1); from 3-methylphenol-sulfonic acid-4 (2) in nitrobenzene solution with  $Cl_2$  (other products are also formed) see (2).]

$\bar{C}$  in  $CHCl_3$  gives with  $Cl_2$  (1 mole) alm. quant. yield (1) 2,4,6-trichloro-3-methylphenol (3:0618), m.p. 46° (1).

$\bar{C}$  in  $CHCl_3$  gives with  $Br_2$  (1 mole) (1) 2,4-dichloro-6-bromo-3-methylphenol, m.p. 58-59° (1).

Ⓐ 2,4-dichloro-3-methylphenyl benzoate: fine plates from alc., m.p. 78-78.5° (1)  
[From  $\bar{C}$  with  $BzCl$  in pyridine (1).]

② 2,4-Dichloro-3-methylphenyl benzenesulfonate: fine ndl.-like pl. from alc., m.p. 69.5° (1). [From  $\bar{C}$  with benzenesulfonyl chloride in pyridine (1).] [Note the proximity of the m.p. of this deriv. to that of the corresp. deriv. of 2,6-dichloro-3-methylphenol (3:0618).]

③ 2,4-Dichloro-3-methylphenyl *p*-toluenesulfonate: shiny pl. from alc., m.p. 100-101° (1). [From  $\bar{C}$  with *p*-toluenesulfonyl chloride in pyridine (1).]

55°	(37)			
54.5°	(18) (154)			
54°	(31)			

Colorless tcls. from dil. alc. or lgr. — Vapors of  $\bar{C}$  are very strongly lachrymatory (see also below). —  $\bar{C}$  is insol. aq. but volatile with steam;  $\bar{C}$  is cas sol. alc., ether, or  $C_6H_6$ .

[For study of soly. of  $\bar{C}$  in EtOH,  $C_6H_6$ ,  $CCl_4$ , or acetophenone over range -23.5° to 53.5° see (19): note that  $\bar{C}$  with  $C_6H_6$  (1:7400) gives (19) a eutectic, m.p. -1.6°, contg. 76 wt. %  $\bar{C}$ ;  $\bar{C}$  with acetophenone (1:5515) gives a eutectic, m.p. +5.9°, contg. 70 wt. %  $\bar{C}$  (19).]

### USES OF $\bar{C}$

In addn. to its uses as a chem. intermediate,  $\bar{C}$  because of its irritant and lachrymatory properties has been much studied as a chemical warfare agent and tear gas under the arbitrary designation "CN."

[For general surveys from this viewpoint see (20) (21). —  $\bar{C}$  is sol. in many org. solvents and is frequently loaded into grenades and shells in such solutions of which three common examples are "CNB" (consisting of  $\bar{C}$  +  $C_6H_6$  +  $CCl_4$ ), "CND" (consisting of  $\bar{C}$  + ethylene dichloride (3:5130)), and "CNS" (consisting of  $\bar{C}$  +  $CHCl_3$  + nitrochloroform = chloropicrin). — For examples of patents on these and other types of tear-gas cartridges and munitions coatg.  $\bar{C}$  see (23) (24) (25) (26) (27); for use of  $\bar{C}$  as insecticide see (28).]

[For dispensing apparatus for  $\bar{C}$  (29) or for mill for disintegration of  $\bar{C}$  (30) see indic. refs.]

[For m.p./compn. diagram of system  $\bar{C}$  + "Adamsite" (10-chloro-9,10-dihydrophenarsazine), eutectic, m.p. 50°, contg. 90 mole %  $\bar{C}$ , see (31).]

[For studies of effect of  $\bar{C}$  on skin see (32) (33) (34); for contamination of food by  $\bar{C}$  see (35).]

### PREPARATION OF $\bar{C}$

From chloroacetyl chloride with benzene. [For prepn. of  $\bar{C}$  from chloroacetyl chloride (3:5235) with  $C_6H_6 + AlCl_3$  (yield 85–88% (15) (64)) (2) (14) (36) (71) see indic. refs.]

From acetophenone. [For prepn. of  $\bar{C}$  from acetophenone (1:5515) with  $Cl_2$  in AcOH (4) (18), in  $CS_2$  (85% yield (37)), in lgr. (38) or directly without solvent (yields 65% (6) (37)) (39) see indic. refs.; from acetophenone (1:5515) by electrolysis of its soln. in HCl (40), or by chlorination with aq. *N*-chlorosuccinimide (41), see indic. refs.]

From benzoyl chloride with diazomethane. [For formn. of  $\bar{C}$  from benzoyl chloride (3:6240) with diazomethane in ether (72% yield) see (3); note, however, that this procedure has subsequently been much disputed, and for discussion see also (42) (43) (44) (45) (46) (47) (48).]

From miscellaneous sources. [For prepn. of  $\bar{C}$  from *N*-( $\alpha,\beta$ -dichlorovinyl)diethylamine (yield 92.6% (49)), from chloroacetonitrile (50), or for possible formn. from chloroacetic acid (3:1370) (51), all with  $C_6H_5MgBr$ , see indic. refs.; for formn. of  $\bar{C}$  from phenyl copper (52), from phenyldichloroarsine (yields: 58.5% (53), 55% (54)) (55), all with chloroacetyl chloride (3:5235), see indic. refs.; for formn. of  $\bar{C}$  from 1-chloro-2-phenylpropanol-2 (styrene chlorohydrin) (3:9570) by oxidn. with  $K_2Cr_2O_7/H_2SO_4$  (1) or from diphenacyltelluride dichloride by oxidn. with  $KMnO_4$  (5) see indic. refs.; for formn. of  $\bar{C}$  from benzalacetophenone (chalcone) (1:5155) by actn. of  $Cl_2$  in *tert*-butyl alc. (other prods. are also formed) see (17).]

### CHEMICAL BEHAVIOR OF $\bar{C}$

#### REDUCTION

No authentic studies on reduction of  $\bar{C}$  appear to be reported.

#### OXIDATION

$\bar{C}$  on oxidn. with  $CrO_3$  (39), or  $K_2Cr_2O_7 + H_2SO_4$  (58) (13) gives benzoic acid (1:0715). —  $\bar{C}$  also reduces  $NH_4OH/AgNO_3$  (13) [perhaps because of some hydrolysis to  $\omega$ -hydroxyacetophenone (1:5180)].

#### HALOGENATION

Chlorination. [ $\bar{C}$  on further chlorination under conditions favoring side-chain substitution would be expected to yield  $\omega,\omega$ -dichloroacetophenone (3:6835) and ultimately  $\omega,\omega,\omega$ -trichloroacetophenone (3:6874), but no authentic record that this has actually been achieved can be found.]

Bromination. [ $\bar{C}$  with  $Br_2$  under suitable conditions gives (56)  $\omega$ -bromo- $\omega$ -chloroacetophenone, m.p. 37–37.5°, b.p. 133–134° at 7.5 mm. (56). —  $\bar{C}$  in AcOH + NaOAc with  $Br_2$  as directed (57) gives a mixt. consisting of 30%  $\omega,\omega$ -dibromo- $\omega$ -chloroacetophenone + 70%  $\omega,\omega,\omega$ -tribromoacetophenone.]

Nitration.  $\bar{C}$  in conc.  $H_2SO_4$  at  $-20^\circ$  treated as directed (9) with a mixt. of fuming  $HNO_3$  ( $D = 1.50$ ) + conc.  $H_2SO_4$  gives (77% yield (9)) *m*-nitrophenacyl chloride, m.p. 103° (59), 102–103° (16), 100.5–102° (9). — [Note that the other two isomeric mononitrophenacyl chlorides, viz., *o*-nitrophenacyl chloride, m.p. 66–67° (60) (61), and *p*-nitrophenacyl chloride, m.p. 107° (62), are also known, but prepd. indirectly; note also that no dinitration prods. of  $\bar{C}$  are known.]

### BEHAVIOR OF $\bar{C}$ WITH OTHER INORGANIC REACTANTS

With water.  $\bar{C}$  does not readily hydrolyze with aq. but on protracted boilg. (e.g., 20 hrs. (63)) with a large vol. of aq. gives  $\omega$ -hydroxyacetophenone (1:5180).]

With nitrous acid.  $\bar{C}$  with  $\text{HNO}_2$  (from *n*-butyl nitrite +  $\text{HCl}$  gas) in dry ether gives (yields: 85.6% (64), 82–86% (15))  $\omega$ -chloro- $\omega$ -isonitrosoacetophenone (phenylglyoxylohydroxamyl chloride) [Beil. X-662,  $X_1$ -(315)], white ndls. from  $\text{CCl}_4$  (64) or from  $\text{CCl}_4$  +  $\text{C}_6\text{H}_6$  (3:1) (15), m.p. 132–133° (15) (64).

With  $\text{PCl}_5$ .  $\bar{C}$  with  $\text{PCl}_5$  on distn. gives (65)  $\alpha,\beta$ -dichlorovinylbenzene ( $\alpha,\beta$ -dichlorostyrene) [Beil. Y-477,  $V_2$ -(367)], b.p. 221°.]

With various salts of inorganic acids.  $\bar{C}$  with  $\text{KI}$  (66) (67) or better  $\text{NaI}$  (38) in alc. gives  $\omega$ -iodoacetophenone (phenacyl iodide) [Beil. VII-286], m.p. 30°; for study of rate of reactn. of  $\bar{C}$  with  $\text{KI}$  in acetone at 0° (11) or with  $\text{NaI}$  or  $\text{LiI}$  in acetone at 0° or –10° (10) see indic. refs.]

$\bar{C}$  does not add  $\text{NaHSO}_3$  (37). —  $\bar{C}$  in alc. with  $\text{Na}_2\text{S}_2\text{O}_3$  (2 moles) in aq. refluxed 20 hrs. gives sodium phenacylthiosulfate which with  $\text{HCl}$  gives (73% yield (69))  $\omega$ -mercaptoacetophenone (phenacyl mercaptan). —  $\bar{C}$  with  $\text{Na}_2\text{S}$  in alc. at 60° gives (70) diphenacyl sulfide [Beil. VIII-94, VIII<sub>1</sub>-(541)], m.p. 76.5–77.2° (70), 76° (147); for use of this reactn. in detn. of  $\bar{C}$  see (14).

With ammonia.  $\bar{C}$  with  $\text{NH}_3$  (1 mole) would be expected to give  $\omega$ -aminoacetophenone (phenacylamino) [Beil. XIV-49, XIV<sub>1</sub>-(368)], but such direct result has never been reported; note, however, that  $\bar{C}$  (1 mole) with hexamethylenetetramine (1 mole) in  $\text{CHCl}_3$  at room temp. for 12 hrs. gives (60% yield (68)) a 1:1 addn. cpd., m.p. 145°, which upon alcoholysis with conc.  $\text{HCl}$  in alc. 3 days in cold gives (63–74% yield (68)) phenacylamino hydrochloride.

$\bar{C}$  with alc.  $\text{NH}_3$  in s.t. at 100° as directed (2) gives a mixt. contg. diphenacylamino hydrochloride [Beil. XIV-53, XIV<sub>1</sub>-(371)], m.p. 235°, together with the hydrochlorides of 2,5-diphenylpyrazine and 2,6-diphenylpyrazine; for discussion of mechanism see (2).]

### BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

#### With Hydrocarbons (+ $\text{AlCl}_3$ )

$\bar{C}$  with  $\text{C}_6\text{H}_6$  +  $\text{AlCl}_3$  in s.t. at 100° failed to react (71). —  $\bar{C}$  with toluene (1:7405) +  $\text{AlCl}_3$  under reflux gives (71) a prod., m.p. 84–85°, which is presumably  $\omega$ -(*p*-tolyl)acetophenone [Beil. VII-448], although this prod. obtd. by other methods has different consts.

#### With Organic Hydroxy (or Mercapto) Compounds

With alcohols.  $\bar{C}$  with  $\text{NaOMe}$  might be expected to yield  $\omega$ -methoxyacetophenone, b.p. 228–230° at 760 mm. (72) (73), b.p. 118–120° at 15 mm. (72) (73), m.p. 7–7.5° (73) (corresp. semicarbazone, m.p. 85° (72), 129° (73) (note disagreement); corresp. 2,4-dinitrophenylhydrazones, m.p. 191–192° (73)); note, however, that no record of this reaction has been reported and the  $\omega$ -methoxyacetophenone is best prepd. (71–78% yield (74)) from methoxyacetoneitrile with  $\text{C}_6\text{H}_5\text{MgBr}$ ; note also that  $\bar{C}$  with alk. reagents such as  $\text{NaOMe}$  reacts in an unexpectedly complex manner yielding (153) cyclic "halogen-diphenacyls."

$\bar{C}$  with  $\text{NaOEt}$  would be expected to yield  $\omega$ -ethoxyacetophenone [Beil. VIII-90], b.p. 134–136° at 21 mm. (75), 130° at 15 mm. (76), 120–122° at 15 mm. (77),  $D_4^{20} = 1.0552$  (77),  $n_D^{20} = 1.5250$  (77) (corresp. oxime, m.p. 55° (75); corresp. semicarbazone, m.p. 128° (75)); note, however, that no record of this reactn. has been reported and the  $\omega$ -ethoxyacetophenone is best prepd. (68% yield (77)) cf. (75) (76) from ethoxyacetoneitrile with

$C_6H_5MgBr$ ; note also that  $\bar{C}$  with alk. reagents such as  $NaOEt$  reacts in an unexpectedly complex manner yielding (153) cyclic "halogen diphenaclys."

$\bar{C}$  (1 mole) with ethylene glycol (1:6465) (1 mole) in  $C_6H_6$  contg. trace of benzenesulfonic acid gives on hgt. (95% yield (81)) the corresp. cyclic ketal, viz., 2-(chloromethyl)-2-phenyl-1,3-dioxolane, m.p.  $67^\circ$ , b.p.  $144-146^\circ$  at 15 mm. (81).]

With phenols.  $\bar{C}$  with dry sodium phenolate (78) gives  $\omega$ -phenoxyacetophenone [Beil. VIII-91], m.p.  $74^\circ$  cor. (79), b.p.  $255-257^\circ$  (78),  $187^\circ$  cor. at 9 mm. (79) (corresp. semicarbazone, m.p.  $187.0-187.5^\circ$  cor. (70)); note, however, that this prod. is best prepd. (45% yield (79)) from phenoxyacetonitrile with  $C_6H_5MgBr$ , or from phenoxyacetyl chloride +  $C_6H_6$  +  $AlCl_3$  cf. (80).]

With mercaptans.  $\bar{C}$  with  $n$ -BuSH in alc.  $NaOH$  gives (82) phenacyl  $n$ -butyl sulfide, b.p.  $140^\circ$  at 3 mm.,  $D_{25}^{25} = 1.0589$ ,  $n_D^{20} = 1.5050$ .]

$\bar{C}$  with sodium  $p$ -nitrothiophenate in aq. alc. on hgt. gives (98% yield (83)) phenacyl  $p$ -nitrophenyl sulfide, yel. pl. from 50-80%  $AcOH$ , m.p.  $118^\circ$ . —  $\bar{C}$  (1 mole) with sodium  $p$ -thiocresolate (1 mole) in  $MeOH$  boiled several hrs. does not give the expected phenacyl  $p$ -tolyl sulfide, m.p.  $37^\circ$  cf. (101); distillation of the reaction prod. gives (58.5% yield (84)) phenacyl  $p$ -tolyl sulfoxide, b.p.  $182-184^\circ$  at 5 mm., m.p.  $46^\circ$  accompanied by acetophenone; note that with  $H_2O_2$  this sulfoxide oxidizes to phenacyl  $p$ -tolyl sulfone, m.p.  $110^\circ$  (see also below).]

### Behavior with Carbonyl Compounds

With aromatic aldehydes.  $\bar{C}$  (1 mole) with benzaldehyde ( $1\frac{1}{2}$  moles) in alc. with alc.  $NaOEt$  (1 mole) in cold condenses with loss of  $HCl$  giving (80% yield (85))  $\alpha$ -benzoyl- $\alpha'$ -phenyl-ethylene oxide (benzalacetophenone oxide) [Beil. XVII-1-(196)], colorless cryst. from alc. (85) or from cold acetone by addn. of pet. ether (86), m.p.  $89-90^\circ$  (85) (86); note that this prod. can also be obtd. in other ways, notably from benzalacetophenone (chalcone) (1:5155) with  $Na_2O_2$  +  $HCl$  in cold (85% yield (86)) or with  $H_2O_2$  in alc. soln. (90% yield (88)) (87) (89); although *cis* and *trans* stereoisomers are possible, only one form is known.]

$\bar{C}$  with *o*-nitrobenzaldehyde in alc.  $NaOEt$  (although this particular pair has not actually been reported) should yield similarly  $\alpha$ -benzoyl- $\alpha'$ -(*o*-nitrophenyl)ethylene oxide [Beil. XVII-1-(197)] since phenacyl bromide behaves (90) in this fashion; note that for this prod. the two expected geom. stereoisomers are both formed, one with m.p.  $175^\circ$ , the other with m.p.  $110^\circ$ .]

$\bar{C}$  with *m*-nitrobenzaldehyde in alc.  $NaOEt$  (although this particular pair has not actually been reported) should give similarly  $\alpha$ -benzoyl- $\alpha'$ -(*m*-nitrophenyl)ethylene oxide [Beil. XVII-1-(197)] since phenacyl bromide behaves in this manner (80% yield (91)); one stereoisomer is known, m.p.  $118^\circ$  (91). — Note, however, that  $\bar{C}$  (1 mole) with *m*-nitrobenzaldehyde (1 mole) in  $AcOH$  satd. with  $HCl$  gas and stood 24 hrs. reacts differently giving (92) *m*-nitrobenzalacetophenone dichloride [Beil. VII-1-(238)], m.p.  $148^\circ$ .]

$\bar{C}$  (1 mole) with *p*-methoxybenzaldehyde (anisaldehyde) (1:0240) (1 mole) in alc.  $NaOEt$  gives (93)  $\alpha$ -benzoyl- $\alpha'$ -(*p*-methoxyphenyl)ethylene oxide, m.p.  $87^\circ$  (93) (89); also obtd. from *p*-methoxybenzalacetophenone (1:9011) with alk.  $H_2O_2$  (89).]

$\bar{C}$  (1 mole) + *o*-nitrobenzalacetophenone (1 mole) in acetone/dioxane with alc.  $NaOEt$  (1 mole) gives in 15 min. but yield not stated (93) 1,2-dibenzoyl-3-(*o*-nitrophenyl)cyclopropane, m.p.  $177^\circ$  (93).]

### Behavior of $\bar{C}$ with Salts of Organic Acids

$\bar{C}$  with salts of organic acids gives in general the corresp. phenacyl esters although when the latter are to be prepd. as means of identification of the acids the more reactive phenacyl

bromide is usually employed; for m.p.'s of the phenacyl esters of various acids of Order I see Vol. I, p. 650.

[ $\bar{C}$  with KCN in dil. alc. on htg. gives (47% yield (94))  $\omega$ -cyanoacetophenone (benzoyl-acetonitrile) [Beil. X-680, X<sub>1</sub>-(322)], m.p. 83° (94), 80-81° (95) (96); this prod. may also be prepd. by other means, e.g., from phenacyl bromide with dil. alc. KCN (60% yield (97)), or from ethyl benzoate with acetonitrile + NaOEt (yields: 60% (96), 56% (95)).]

[ $\bar{C}$  with KSCN in MeOH (98) or EtOH (65) gives  $\omega$ -thiocyanoacetophenone (phenacyl thiocyanate) [Beil. VIII-94], m.p. 74.1-76.6° cor. (98), 74° (99).]

[ $\bar{C}$  with sodium *p*-toluenesulfinate in boilg. alc. gives (100) cf. (101) phenacyl *p*-tolyl sulfone ( $\omega$ -(*p*-toluenesulfonyl)acetophenone), m.p. 110° (100) (see also above for formn. of this prod. from  $\bar{C}$  + sodium thio-*p*-cresolate).]

### Behavior of $\bar{C}$ with RMgX Compounds

[ $\bar{C}$  (1 mole) with EtMgBr (1 mole) in dry ether gives an addn. prod. which after evapn. of ether, htg. at 130-140°, and hydrolysis gives (yield not stated (102)) benzyl ethyl ketone (1-phenylbutanone-2) [Beil. VI-311, VII<sub>1</sub>-(167)], b.p. 222-227° (103), 221-223° (102), 110° at 13 mm. (101) (corresp. semicarbazone, m.p. 156-156.5° cor (103), 150-153° (103), 153° (106),  $\beta$ -form 152°,  $\alpha$ -form 146° (101), 146° (102), corresp. 2,4-dinitrophenylhydrazone, m.p. 140-141° (103)); not rearr. in formn. of this prod. by this method]

[ $\bar{C}$  with *n*-hexyl-1-yl MgBr in dry ether adds normally and on hydrolysis gives (107) the expected 1-chloro-2-phenyl-1-nonyn-3-ol-2]

### Behavior of $\bar{C}$ with Amines

With primary aliphatic amines. [ $\bar{C}$  (1 mole) with MeNH<sub>2</sub> (2.5 moles) in alc. for 5-6 hrs in cold gives (108)  $\omega$ -(methylamino)acetophenone [Beil. XIV-50, XIV<sub>1</sub>-(369)] (corresp. B.HCl (23% yield (108)), m.p. 210° (108)). —  $\bar{C}$  with *n*-BuNH<sub>2</sub> similarly gives (35% yield (108))  $\omega$ -(*n*-butylamino)acetophenone hydrochloride, m.p. 214-215° (108)]

[ $\bar{C}$  with  $\beta$ -aminoethanol (ethanolamine) readily gives (109) *N*-( $\beta$ -hydroxyethyl)phenacyl-amine, m.p. 144° (109).]

With primary aromatic amines. [ $\bar{C}$  with aniline should yield *N*-(phenacyl)aniline [Beil. XIV-51, XIV<sub>1</sub>-(369)], m.p. 98-99° (110) (corresp. oxime, m.p. 105-106° (111); corresp. semicarbazone, m.p. 171° (110)); however, although the rate of this reaction in abs. alc. at 40° (38) and in 90% alc. at 30.5° (16) cf. (112) has been studied, the usual method of prepn. of *N*-(phenacyl)aniline is from phenacyl bromide + aniline — *Pure N*-(phenacyl)aniline, contrary to earlier statements, is remarkably stable and can be exposed to air at room temp. for 18 months or distilled under reduced press. (b.p. 208-210° at 12 mm.) without change (113); for important study of mechanism of conversion of *N*-(phenacyl)aniline to 2-phenylindole see (113) (114).]

[The behavior of  $\bar{C}$  with the three toluidines has not itself been studied but should be similar to that of phenacyl bromide which with *o*-toluidine gives (115) (116) *N*-(phenacyl)-*o*-toluidine [Beil. XIV-52, XIV<sub>1</sub>-(370)], m.p. 91° (116), 89° (115) (corresp. oxime, m.p. 92° (116)); with *m*-toluidine gives *N*-(phenacyl)-*m*-toluidine, m.p. 110° (117); with *p*-toluidine gives *N*-(phenacyl)-*p*-toluidine [Beil. XIV-52, XIV<sub>1</sub>-(370)], m.p. 134° (118), 127° (115) (corresp. oxime in two geom. stereoisomers of m.p. 97° and 92°, resp. (111))]

With secondary aliphatic amines. [ $\bar{C}$  with Me<sub>2</sub>NH should yield  $\omega$ -(dimethylamino)-acetophenone (phenacyl dimethylamine) [Beil. XIV-50], h.p. 126-128° at 18 mm. (119), 122-123° at 14 mm. (120) (corresp. B.HCl, m.p. 174° (120), corresp. B.HBr, m.p. 184-186° (121), corresp. B.KOH, m.p. 150° (119), 143° (122), 141° (123)); note, however,

that this particular combination of reactants has not actually been reported and that the  $\omega$ -(dimethylamino)acetophenone is usually obt'd. from phenacyl bromide with  $\text{Me}_2\text{NH}$  (119) (121), or from dimethylaminoacet-*N,N*-dimethylamide with  $\text{C}_6\text{H}_5\text{MgBr}$  (80% yield (120) (125)).]

[ $\bar{\text{C}}$  (1 mole) with  $\text{Et}_2\text{NH}$  (2 moles) in  $\text{C}_6\text{H}_6$  stood 2 days at room temp. ppts.  $\text{Et}_2\text{NH}\cdot\text{HCl}$  and gives (65% yield (125))  $\omega$ -(diethylamino)acetophenone, b.p. 148–152° at 30 mm. (125),  $n_D^{25} = 1.5180$  (125).]

[ $\bar{\text{C}}$  + *bis*-( $\beta$ -hydroxyethyl)amine (diethanolamine) in  $\text{C}_6\text{H}_6$  on long boilg. gives (109) *N*-phenacyl-*N,N*-bis-( $\beta$ -hydroxyethyl)amine, m.p. 44° (109).]

With secondary heterocyclic amines. [ $\bar{\text{C}}$  with piperidine in dry ether splits out  $\text{HCl}$  and yields (126)  $\omega$ -(piperidino)acetophenone (*N*-(phenacyl)piperidine) [Beil. XX-42], b.p. 180–181° cor. at 26 mm. (127), 157° at 15 mm. (128), 163–164° at 13 mm. (126),  $D_4^{21.2} = 1.0430$  (126),  $n_D^{22.4} = 1.5403$  (126) (corresp.  $\bar{\text{B}}\cdot\text{HCl}$ , m.p. 226–227° (129), corresp.  $\bar{\text{B}}\cdot\text{HBr}$ , m.p. 227–228° (135), corresp. oxime, m.p. 112–115° (130)).]

[ $\bar{\text{C}}$  with morpholine in dry ether ppts. morpholine  $\text{HCl}$  and yields (131)  $\omega$ -(morpholino)acetophenone (*N*-(phenacyl)morpholine), m.p. 50–52° (132) (corresp.  $\bar{\text{B}}\cdot\text{HCl}$ , m.p. 222–223° cor. (133), 219–223° (134), 213–214° dec. (131), 212–214° (132); corresp.  $\bar{\text{B}}\cdot\text{KOH}$ , m.p. 156–157° (132)).]

[ $\bar{\text{C}}$  (1 mole) with *N'*-phenylpiperazine (2 moles) in dry ether at room temp. for several hrs. (136) or  $\bar{\text{C}}$  (1 mole) with *N'*-phenylpiperazine (1 mole) + slight excess anhydr.  $\text{Na}_2\text{CO}_3$  in alc. refluxed  $\frac{1}{2}$  hr. (136) gives 80–85% yield *N*-phenacyl-*N'*-phenylpiperazine, m.p. 106–108° cor. (136) (corresp.  $\bar{\text{B}}\cdot\text{HCl}$ , m.p. 210–212° cor.; corresp. oxime, m.p. 157–158° cor. (136)).]

[Note, however, that  $\bar{\text{C}}$  with 3-carbethoxy-2-methylpyrrole +  $\text{AlCl}_3$  in  $\text{CS}_2$  does not acylate the nitrogen but gives Friedel-Crafts type reaction yielding (137) 3-carbethoxy-2-methyl-6-phenacylpyrrole, m.p. 205°.]

With tertiary aliphatic amines. [Direct addn. of  $\bar{\text{C}}$  to  $\text{Me}_3\text{N}$  appears not to have been reported; the quaternary salt to be expected, viz., phenacyl-trimethyl-ammonium chloride, m.p. 204° dec. (138), 202° (121), has been prep'd. indirectly.]

With tertiary aromatic amines. [The quaternary salt, viz., dimethyl-phenyl-phenacyl-ammonium chloride, to be expected from  $\bar{\text{C}}$  + dimethylaniline is unreported.]

With tertiary heterocyclic amines. (See also below under  $\bar{\text{D}}$ 's.)

[ $\bar{\text{C}}$  (1 mole) with pyridine (1 + moles) in dry  $\text{C}_6\text{H}_6$  on warming gives (25% yield (139)) phenacyl-pyridinium chloride, m.p. 109–110° (139), 113° (140); note that this prod. with aq. 20%  $\text{NaOH}$  at room temp. . . . . h.p. 127° at 12 mm. (141). — For st . . . . . 5.6° (142) or in 90% alc. at 30.5° (16) cf. (112) see indie. refs.]

#### Behavior of $\bar{\text{C}}$ with Arylhydrazines

(See also below under  $\bar{\text{D}}$ 's.) —  $\bar{\text{C}}$  with many arylhydrazines does not yield the corresp. arylhydrazones because the reaction takes a different course.

$\bar{\text{C}}$  (2 g.) with phenylhydrazine (1.4 g.) in warm  $\text{EtOH}$  (20 ml.) contg.  $\text{NaOAc}\cdot 3\text{H}_2\text{O}$  in aq. (10 ml.) ppts. (14) a yellow solid, m.p. 137° dec. (14), regarded as 1,3-diphenyl-(1,2-diazacyclobutene-2). — Similarly,  $\bar{\text{C}}$  with *o*-tolylhydrazine gives (14) 1-(*o*-tolyl)-3-phenyl-(1,2-diazacyclobutene-2), m.p. 147.2° (14);  $\bar{\text{C}}$  with *p*-tolylhydrazine gives (14) 1-(*p*-tolyl)-3-phenyl-(1,2-diazacyclobutene-2), m.p. 159.8° dec. (14);  $\bar{\text{C}}$  with *p*-nitrophenylhydrazine gives (14) 1-(*p*-nitrophenyl)-3-phenyl-(1,2-diazacyclobutene-2), m.p. 173° dec. (14). — [For further discussion of structures of these prods. see also (143).]

*Behavior of  $\bar{C}$  with Other Miscellaneous Nitrogenous Reactants*

$\bar{C}$  with diazomethane in dry ether + MeOH for 12 hrs. gives (88% yield (144)) 3-chloro-2-phenyl-1,2-epoxypropane ( $\alpha$ -chloromethyl- $\alpha$ -phenyl-ethylene oxide), b.p. 135-137° at 17 mm. (144).]

③ Chloromethyl phenyl ketoxime: cryst. from CS<sub>2</sub>, m.p. 88.5-89° (4), 88-89° (17). [From  $\bar{C}$  (1 mole) + hydroxylamine hydrochloride (3 moles) in dil. MeOH stood overnight, prod. pptd. by addn. of aq. (1); note that this oxime on Beckmann rearr. with PCl<sub>5</sub> gives (4)  $\omega$ -chloroacetanilide, m.p. 134.5° (5).]

④ Chloromethyl phenyl ketone 2,4-dinitrophenylhydrazine: orange cryst., m.p. 212° cor. (145). [See above for behavior of  $\bar{C}$  with various other arylhydrazines.]

⑤ Chloromethyl phenyl ketone semicarbazone: m.p. 160° on "Maquenne bloc" (1), 156° (146), 149° (147). [From  $\bar{C}$  (3.1 g.) in alc. (25 ml.) with semicarbazide hydrochloride (2.2 g.) in aq. (12.5 ml.) at 40° on addn. of NaHCO<sub>3</sub> (1.7 g.) in small increments; yield 71% (147); for study of chem. behavior of this prod. see (147).]

— *N*-(Phenacyl)phthalimide ( $\omega$ -phthalimidoacetophenone) [Bell. XXI-479]: m.p. 167° u.c. (148), 166° (149). [This prod. has never been reported from  $\bar{C}$  + K phthalimide but has been prepd. indirectly. However, for its prepn. from phenacyl bromide with K phthalimide see (150).]

— *N*-(Phenacyl)tetrachlorophthalimide ( $\omega$ -(tetrachlorophthalimido)acetophenone): pl. from CHCl<sub>3</sub> on pouring into MeOH, m.p. 258-259° (151). [From  $\bar{C}$  (?) or phenacyl bromide with K tetrachlorophthalimide (151).]

⑥ Condensation prod. from  $\bar{C}$  with *N*-methyl- $\beta$ -(carbohydrazido)pyridinium *p*-toluenesulfonate: cryst. from EtOH/ether 1:1, m.p. 120° cor. (152). [From  $\bar{C}$  + the quat. salt of nicotinic acid hydrazide with methyl *p*-toluenesulfonate (152).]

46-47°	(12)
46°	(13)

[See also anhydrous chloral (3:5210) and chloral ethylalcoholate (3:0860).]

The m.p. of  $\bar{C}$  is profoundly affected by mode of heating and by pressure (1) (2) but when taken in test tube in ord. m.p. apparatus is claimed to be consistently 59-60° (2). — [For especially extensive studies on the m.p. of  $\bar{C}$  see (1) (2) (6) (10).]

$\bar{C}$  undergoes a transition point at 32° detectable by dilatometric methods (15). Furthermore,  $\bar{C}$  on heating dissociates into anhydrous chloral and  $\text{H}_2\text{O}$ ; the temperature at which dissocn. begins is unknown, but dissocn. is complete at 78° (15).

Ordinary  $\bar{C}$  is definitely the monohydrate, but other hydrates of chloral (3:5210) have been claimed (6). However, the suggestion (16) that  $\bar{C}$  may exist in two modifications appears to be discredited (6) (10).

[For study of crystal structure of  $\bar{C}$  see (18); for density and refractive index of various solns. of  $\bar{C}$  in aq., EtOH, or toluene see (12); for study of toxicity of  $\bar{C}$  see (10).]

Note that  $\bar{C}$  on hgt. does not give inflammable vapor (diff. from chloral ethylalcoholate (3:0860)).

$\bar{C}$  is eas. sol. in aq. or alc.; much less sol. in  $\text{CHCl}_3$  or toluene. [E.g., 1 pt. aq. dissolves following parts  $\bar{C}$  at indic. temps.: at 0°, 2.4; at 5°, 2.9; at 10°, 3.8; at 15°, 4.9; at 20°, 6.6; at 25°, 8.3; at 30°, 10.1; at 35°, 12.1; at 40°, 14.3 pts.  $\bar{C}$  (20).] — Aq. solns. of  $\bar{C}$  are frequently designated as chloral sirup; for study of stability of such solns. see (21).

CHEMICAL BEHAVIOR OF  $\bar{C}$ 

Important note. The chemistry of chloral hydrate ( $\bar{C}$ ) on one hand and that of anhydrous chloral (3:5210) on the other is so closely interwoven that the division of material between them in this book is necessarily arbitrary. Most of the definite chemical reactions of chloral hydrate have been associated with the text of anhydrous chloral (3:5210), which should always be consulted. Certain methods for the detection and for determination of chloral and chloral hydrate, however, are brought together here under the latter.

DETERMINATION OF  $\bar{C}$ 

For the quantitative detn. of  $\bar{C}$  several different principles have been employed as further explained below.

By behavior with alkali. This method is based upon the fact that  $\bar{C}$  with aq. alkali undergoes hydrolytic cleavage to  $\text{CHCl}_3$  (3:5050) and formic acid (1:1005); since the

latter is neutralized 1 equivalent of alkali is used up for each mole of formic acid produced and therefore for each mole of  $\bar{C}$  originally present. Since on the one hand the  $\text{CHCl}_3$  produced is readily volatile and since on the other it is itself attacked by the excess alkali, some standardization of conditions is required. The process usually involves use of a known amount (excess) of standard alkali followed by back titration with standard acid.

[For especially valuable summaries and discussion of this method see (22) (23); for additional material on characteristics of this method see (24) (25) (26) (27) (28) (29) (30) (31) (32) (33) (34) (35) (41); for discussion of detn. of the formate produced see (22).]

If the sample contains other substances which independently react with alkali and thus interfere with the above method,  $\bar{C}$  may be determined by reduction to acetaldehyde (1:0100) and characterization of the latter. E.g.,  $\bar{C}$  with  $\text{Zn} + \text{strong HCl}$  (36) (37), or with  $\text{Zn} + \text{dil. H}_2\text{SO}_4$  (37) (38) (27) cf. (42), gives acetaldehyde (1:0100); this may be detd. as *p*-nitrophenylhydrazone (36) (or otherwise) or if  $\text{H}_2\text{SO}_4$  was used total chloride ion may be determined (42). This reduction to acetaldehyde is of value in detn. of  $\bar{C}$  in presence of  $\text{CHCl}_3$  (3:5050) or of  $\alpha,\alpha,\beta$ -trichloro-*n*-butyraldehyde ("butyrylchloral") (3:5910) (38).

By determination of total chlorine as chloride ion. In addition to the reduction methods (mentioned in the preceding paragraph) for conversion of all the chlorine of  $\bar{C}$  to chloride ion, this may also be effected by complete hydrolysis with alkali (usually alcoholic alkali best in pressure bottle (39)) (40) (41); for extensive review of methods based on this principle see (22); the total chloride ion is afterward detd. by conventional methods.

By oxidation methods. By appropriate reagents  $\bar{C}$  can be oxidized to trichloroacetic acid (3:1150); by use of a known amount (excess) of standard soln. of oxidant followed by back titration to determine residual oxidant, the amount corresp. to oxidn. of  $\bar{C}$  can be detd. For studies of this method using  $\text{I}_2$  (22) (42) (34) (43),  $\text{Br}_2$  (42),  $\text{KMnO}_4$  (42), or  $(\text{NH}_4)_2\text{S}_2\text{O}_8$  (44) see indie. refs.

#### DETECTION OF $\bar{C}$ BY VARIOUS COLOR REACTIONS

With various phenols. [For color tests with resorcinol (1:1530) + aq. alk. (45), with pyrogallol (1:1555) + 60%  $\text{H}_2\text{SO}_4$  (use in distinction from "butyrylchloral" (3:5910) (46)), with phloroglucinol (1:1620) + aq. alkali (47) (49) see indie. refs.]

[For behavior of  $\bar{C}$  with resorcinol (1:1530) +  $\text{KBr} + \text{conc. H}_2\text{SO}_4$  see (52).]

With pyridine + aq. alk. Since  $\bar{C}$  with aq. alk. on warming gives  $\text{CHCl}_3$  (3:5050), detection of the latter by means of the pink to red color produced with pyridine in pres. of conc. aq. alkali (Fujiwara reaction) may be used as indirect test for  $\bar{C}$  (48) (51). Note, however, that the test is not specific since it is given by various other trihalogen compounds. [For further information on the Fujiwara reaction see also under trichloroethylene (3:5170).]

With fuchsin-aldehyde reagent. Note that  $\bar{C}$  (unlike chloral (3:5210)) does not give color with fuchsin-aldehyde reagent (50).

**D 1,1,1-Trichloro-2-methylpropanol-2 ("Chlorethane"):** M.p. 96°. Convert  $\bar{C}$  with aq. alk. to  $\text{CHCl}_3$  (3:5050) and derivatize the latter by combination with acetone to "chloroethane" (3:2662).

61° (4)	258-259° (3)
59-60° (5) (6)	143-147° at 18-20 mm. (4)
59° (7)	
58° (8)	
58-60° (9)	

[See also *p*-chlorocarracrol (3:0480)]

Note that  $\bar{C}$  is also known as 4-chlorothymol (Beilstein) and as 6-chlorothymol (C.A.) according to differing methods of numbering the thymol nucleus.

### PREPARATION OF $\bar{C}$

From thymol. [For prepn. of  $\bar{C}$  from thymol (1:1430) by chlorination with  $\text{Cl}_2$  in aq.  $\text{Na}_2\text{CO}_3$  (80% yield (10)), with  $\text{Cl}_2$  in  $\text{AcOH}$  (50% yield (8)), or with  $\text{SO}_2\text{Cl}_2$  (1) (9) in  $\text{CHCl}_3$  (5) see indic. refs.]

From 4-chloro-3-methylphenol (4-chloro-*m*-cresol). [For prepn. of  $\bar{C}$  from 4-chloro-3-methylphenol (3:1535) by conversion with isopropyl alcohol or isopropyl chloride

(3:7025) (11) or with propylene (3) to 4-chloro-3-methylphenyl isopropyl ether and subsequent rearr. (11) (3), e.g., with  $\text{H}_2\text{SO}_4/\text{AcOH}$  (6), to  $\bar{\text{C}}$ , see indic. refs.]

From other sources. [For prepn. of  $\bar{\text{C}}$  from 4-amino-2-isopropyl-5-methylphenol via diazotization and use of  $\text{CuCl}_2/\text{ZnSO}_4$  see (4).]

### BIOCHEMICAL ASPECTS AND USES OF $\bar{\text{C}}$

$\bar{\text{C}}$  as a halogenated phenol has been widely considered as an antiseptic, bactericide, disinfectant, germicide, fungicide, etc.; while this aspect cannot here be recorded in detail, the following examples may serve as leading references.

[For general and technical articles on bactericidal (12) (13) (14) (15) (16) (17) (18), fungicidal (12) (19) (20) (21), or anthelmintic (22) action of  $\bar{\text{C}}$  see indic. refs.; for patents on various means of improving the aqueous solubility of  $\bar{\text{C}}$  for use as germicide see (23) (24) (25) (26) (27) (28) (2) (29); for patent on use of  $\bar{\text{C}}$  in mouthwash see (30); for use as disinfectant of a mixt. of  $\bar{\text{C}}$  (2 pt.) with camphor (1 pt.) (which mixt. is liquid above  $5^\circ$ ) see (31).]

### CHEMICAL BEHAVIOR OF $\bar{\text{C}}$

Reduction. [ $\bar{\text{C}}$  in aq. alk. with  $\text{H}_2$  + cat. at  $180^\circ$  and 30 atm. (32), or  $\bar{\text{C}}$  in aq. alk. with Fe filings at  $170^\circ$  or at  $200^\circ$  under pressure (33) gives (100% yield (32)) thymol (1:1430), m.p.  $51.5^\circ$ .]

Oxidation.  $\bar{\text{C}}$  on oxidation with  $\text{CrO}_3$  (8) or with  $\text{MnO}_2$  in ice-cold conc.  $\text{H}_2\text{SO}_4$  (1) gives thymoquinone (1:9003), m.p.  $45.5^\circ$ .

### Reactions Involving Nuclear Substitution of $\bar{\text{C}}$

Bromination. [ $\bar{\text{C}}$  with  $\text{Br}_2$  in  $\text{AcOH}$  gives (8) a mixt. of products.]

Nitration. [ $\bar{\text{C}}$  in lt. pct. floated on an aqueous soln. of nitrous acid (from  $\text{NaNO}_2 + \text{HCl}$ ) for a week gave (8) 4-chloro-2-isopropyl-5-methyl-6-nitrophenol [Beil. VI-542, VI-1-(267)], pale yel. ndls. from alc., m.p.  $116^\circ$  (8) (34). — Note that attempts to effect direct nitration of  $\bar{\text{C}}$  with  $\text{HNO}_3$  in  $\text{AcOH}$  below  $20^\circ$  (8) give a mixt. of products; also that  $\bar{\text{C}}$  in dry  $\text{CHCl}_3$  at  $-20^\circ$  with  $\text{NO}_2$  (from btg. dry  $\text{Pb}(\text{NO}_3)_2$ ) gives (8) 4-chloro-3,4,6-trinitro-2-isopropyl-5-methyl-cyclohexadien-2,5-dione-1 [Beil. VII-1-(100)], yel. cryst., m.p. about  $105^\circ$  dec. (8).]

Mercuration. [For patents on mercuration of  $\bar{\text{C}}$  see (35) (36).]

Miscellaneous nuclear substitutions. [Note that  $\text{Na}\bar{\text{A}}$  with benzyl chloride (3:8535) in toluene at  $110^\circ$  for 4 hrs. gives (by nuclear benzylation) (37) 4-chloro-6-benzyl-2-isopropyl-3-methylphenol, b.p.  $180^\circ$  at 3 mm. (37).]

[ $\bar{\text{C}}$  with  $\text{SCl}_2$  in  $\text{CS}_2$  gives (65% yield (5)) a sulfide,  $\text{C}_{20}\text{H}_{24}\text{O}_2\text{Cl}_2\text{S}$ , m.p.  $110-111^\circ$ , of undetermined structure.]

### Reactions Involving the Phenolic Group of $\bar{\text{C}}$

(See also below under  $\bar{\text{C}}$ 's.)

[ $\bar{\text{C}}$  with  $\text{PCl}_5$  at  $180-200^\circ$  for 2 hrs. gives (9) 2,5-dichloro-p-cymene [Beil. V-423, V-2-(326)], h.p.  $240-243^\circ$ ; this prod. on oxidn. with dil.  $\text{HNO}_3$  ( $D = 1.15$ ) in s.t. at  $180^\circ$  for 10 hrs. gives (38) 2,5-dichloroterephthalic acid [Beil. IX-847], m.p.  $305^\circ$  (38) (corresp. dimethyl ester, m.p.  $136^\circ$  (38)).]

[For behavior of  $\bar{\text{C}}$  with  $\text{POCl}_3$  giving compds. of types  $\text{ROPOCl}_2$  and  $(\text{RO})_2\text{POCl}$  ( $\text{R} = p\text{-chlorothymyl}$ ) see (39); for clinical tests of sodium salt of  $p\text{-chlorothymylphosphoric}$  acid "thymophogen") with tuberculosis see (40); for prepn. of such salt see (41).]

—  $p\text{-Chlorothymyl}$  methyl ether: oil, b.p.  $251^\circ$  cor. at 760 mm. (1). [From  $\bar{\text{C}}$  with  $\text{MeI} + \text{KOH}$  (1) or from thymyl methyl ether with  $\text{SO}_2\text{Cl}_2$  (42).]

- *p*-Chlorothymyl ethyl ether: unreported.  
 — *p*-Chlorothymyl acetate: oil, b p. 112–114° at 2 mm. (43). [From  $\bar{C}$  with  $Ac_2O$  (9) or  $AcCl$  (44); for Fries rearr. to the corresp. acetophenone deriv. see (44) cf. (43).]  
 (9) *p*-Chlorothymyl benzoate: m.p. 71–73° (9). [From  $\bar{C}$  with  $BzCl$  in aq.  $KOH$  (9).]  
 (7) *p*-Chlorothymyl benzyl ether: m.p. 55° (7).  
 (7) *p*-Chlorothymyl *o*-nitrobenzyl ether: m.p. 117° (7).  
 — *p*-Chlorothymyl *p*-nitrobenzyl ether: unreported.  
 — *p*-Chlorothymoxyacetic acid: unreported.

3:1300  $\beta$ -CHLOROISOCROTONIC ACID

(cis-3-Chlorobuten-2-oic acid-1)

 $\text{C}_4\text{H}_5\text{O}_2\text{Cl}$  · Beil. II - 416 $\Pi_1$ -(190) $\Pi_2$ -(396)

M.P. 62°	(1)	B.P. 104.8° cor. (11)	$D_4^{25} = 1.1995$ (7)
61.5°	(2)		$n_D^{25} = 1.47039$ (7)
61°	(3) (4) (5)		
	(6) (7) (8)		
60.5°	(9)		
50.5-60.5°	(10)		
59.5°	(11) (17)		

[See also  $\beta$ -chlorocrotonic acid (3:2625).]

Cryst. from aq. or pet. ether. —  $\bar{C}$  is somewhat less sol. in aq. than its stereoisomer (3:2625); e.g.,  $\bar{C}$  is sol. in 52.4 pts. aq. at 19° (12), in 79 pts. aq. at 7° (11). —  $\bar{C}$  is very easily volatile with steam (11) (dif. from  $\beta$ -chlorocrotonic acid (3:2625)). —  $\bar{C}$  in either *cis*- $\alpha,\beta$ -dichloroethylene (3:5042) or *trans*- $\alpha,\beta$ -dichloroethylene (3:5028) is very much more sol. than the stereoisomeric  $\beta$ -chlorocrotonic acid (3:2625) (13). —  $\bar{C}$  sublimes even at room temp. (11).

For f.p./compn. data and diagram of system  $\bar{C}$  + the stereoisomeric  $\beta$ -chlorocrotonic acid (3:2625) (eutectic, m.p. 38.9° contg. 66.8 molo %  $\bar{C}$ ) see (14).

Preparation. [The most frequently used method of prepn. of  $\bar{C}$  is that from ethyl acetoneacetate (1:1710) with  $\text{PCl}_5$ ; this treatment leads to the formn. of a mixt. of the acid chlorides of  $\bar{C}$  and the stereoisomeric  $\beta$ -chlorocrotonic acid (3:2625) which upon hydrolysis with aq. gives a mixt. of the two acids; from this mixture  $\bar{C}$  is removed (together with any unreacted ethyl acetoneacetate) by distillation with steam; the yield of mixed acids is variously reported, e.g., 43.7% (3), 36.5% (9); the yield of  $\bar{C}$  is relatively small, e.g., 26.8% (3), 13% (1). — The  $\text{PCl}_5$  reactn. has often been carried out in dry  $\text{C}_6\text{H}_6$  (8) (15) (9) (3), but its use is regarded (1) as disadvantageous. — For many important details of procedure see indic. refs.]

[For formn. of  $\bar{C}$  from  $\alpha,\beta,\beta$ -trichloro-*n*-butyric acid (3:0925) by removal of the  $\alpha$ - and one  $\beta$ -chlorine atom with Zn see (16); from the stereoisomeric  $\beta$ -chlorocrotonic acid (3:2625) by hgt. at 150-160° for 20 hrs. (17) or at 130° in s.t. (18) see indic. refs.]

Chemical behavior. [ $\bar{C}$  in alc. or in aq. NaOH with  $\text{H}_2$  + Pd/BaSO<sub>4</sub> (4), or  $\bar{C}$  (as Na $\bar{A}$ ) with 2½% Na/Hg in aq. (19), yields mainly isocrotonic acid (1:1045) together with some crotonic acid (1:0425) and tetrolic acid,  $\text{CH}_3-\text{C}\equiv\text{C}-\text{COOH}$ ; note that  $\bar{C}$  is thus dehalogenated more rapidly (4) than the stereoisomeric  $\beta$ -chlorocrotonic acid (3:2625), and that with excess  $\text{H}_2$  the products are further reduced to *n*-butyric acid (1:1035).]

$\bar{C}$  on oxidn. with aq.  $\text{KMnO}_4$  yields (20) only AcOH (1:1010) and oxalic acid (1:0445).

$\bar{C}$  with  $\text{Cl}_2$  in  $\text{CS}_2$  soln. adds 1 mole halogen yielding (16)  $\alpha,\beta,\beta$ -trichloro-*n*-butyric acid (3:0925), m.p. 52°;  $\bar{C}$  undoubtedly adds 1  $\text{Br}_2$  to yield  $\beta$ -chloro- $\alpha,\beta$ -dibromo-*n*-butyric acid but the latter has never been reported.

$\bar{C}$  behaves as a monobasic acid; dissociation const. at 25° =  $9.47 \times 10^{-5}$  (21). —  $\bar{C}$  on neutralization with cold dil. alk. gives Neut. Eq. 120.5. — Note, however, that with strong aq. KOH  $\bar{C}$  is somewhat more resistant than its stereoisomer (3:2625); e.g.,  $\bar{C}$  with 3-4 *N* KOH at 115-120° (16) cf. (22) gives acetone (1:5400) +  $\text{K}_2\text{CO}_3$  + KCl; with 7-8% KOH at 125-130° same + some tetrolic acid.

Salts. [ $\text{NH}_4\text{H}\bar{A} \cdot \text{H}_2\text{O}$  (11);  $\text{Na}\bar{A} \cdot \frac{1}{2}\text{H}_2\text{O}$ , very sol. aq. or slc. (11);  $\text{K}\bar{A} \cdot \text{H}_2\text{O}$ , sol. in 13.2 pts. alc. at 14° (24);  $\text{Ag}\bar{A}$ , alm. insol. cold aq.; on hgt. with aq. in s.t. at 170° dec. much more readily (24) than its stereoisomer (3:2625) into  $\text{CO}_2$  + propadiene (allylene):

$\text{Mg}\bar{\text{A}}_2 \cdot 5\text{H}_2\text{O}$ ,  $\text{Ca}\bar{\text{A}}_2 \cdot 3\text{H}_2\text{O}$ ,  $\text{Ba}\bar{\text{A}}_2 \cdot 2\text{H}_2\text{O}$ ,  $\text{Zn}\bar{\text{A}}_2 \cdot 2\frac{1}{2}\text{H}_2\text{O}$ ,  $\text{Mn}\bar{\text{A}}_2 \cdot 2\text{H}_2\text{O}$ ,  $\text{Co}\bar{\text{A}}_2 \cdot 6\text{H}_2\text{O}$ ,  $\text{Ni}\bar{\text{A}}_2 \cdot 6\text{H}_2\text{O}$ , all sol. aq. (11);  $\text{Pb}\bar{\text{A}}_2 \cdot 4\text{H}_2\text{O}$ , spar. sol. aq. (11).]

$\bar{\text{C}}$  with  $\text{PCl}_5$  (25) or with  $\text{SOCl}_2$  (26) gives (yield 90% (26)) (29)  $\beta$ -chloroisocrotonyl chloride, b.p.  $135\text{--}136^\circ$  at 760 mm.; see also comments under  $\beta$ -chlorocrotonic acid (3:2625).

[ $\bar{\text{C}}$  (as  $\text{K}\bar{\text{A}}$ ) with alc.  $\text{NaOEt}$  on bfg. gives after acidification (17)  $\beta$ -ethoxycrotonic acid [Beil. III-371, III<sub>1</sub>-(135)], m.p.  $137\text{--}138^\circ$  (17),  $141^\circ$  (27); note that during reactn. isomerization has occurred and that this prod. is the same as is similarly obtd. from  $\beta$ -chlorocrotonic acid (3:2625). —  $\bar{\text{C}}$  (as  $\text{Na}\bar{\text{A}}$ ) with  $\text{Na}$  benzylate on bfg. gives after acidification (28)  $\beta$ -benzyloxycrotonic acid, m.p.  $121\text{--}122^\circ$  (28), the same as does the stereoisomer. —  $\bar{\text{C}}$  (as  $\text{Na}\bar{\text{A}}$ ) with  $\text{Na}$  salt of benzyl mercaptan in alc. on hfg. gives after acidification (28)  $\beta$ -benzylmercaptoisocrotonic acid, m.p.  $130^\circ$ ; note that here isomerization does not occur.]

[For behavior of  $\bar{\text{C}}$  (as  $\text{NH}_4\bar{\text{A}}$ ) with  $(\text{NH}_4)_2\text{SO}_3$  yielding  $\beta$ -sulfoisocrotonic acid (3), or of  $\bar{\text{C}}$  (as  $\text{K}\bar{\text{A}}$ ) with  $\text{K}_2\text{AsO}_3$  yielding (10)  $\beta$ -arsonocrotonic acid, see indic. refs.; note that in both cases the products are identical with those obtd. by similar treatment of  $\beta$ -chlorocrotonic acid (3:2625)]

— Methyl  $\beta$ -chloroisocrotonate: b.p.  $142^\circ$ . See 3:8028. [For rate of esterification of  $\bar{\text{C}}$  with  $\text{MeOH}$  see (30).]

— Ethyl  $\beta$ -chloroisocrotonate: b.p.  $165^\circ$ . See 3:8325.

②  $\beta$ -Chloroisocrotonamide: lfts. from aq., m.p.  $109\text{--}110^\circ$  (25). [From  $\beta$ -chloroisocrotonyl chloride (see above) with conc. aq.  $\text{NH}_4\text{OH}$  (25).] [For study of solubility in *cis*-1,2-dichloroethylene (3:5042) and in *trans*-1,2-dichloroethylene (3:5028) see (13).]

③  $\beta$ -Chloroisocrotonanilide: ndls. from alc., m.p.  $106^\circ$  (25). [From  $\beta$ -chloroisocrotonyl chloride (see above) with aniline + excess cold dil. aq.  $\text{NaOH}$  in 100% yield (25).]

④  $\beta$ -Chloroisocroton- $\alpha$ -naphthalide: ndls. from alc., m.p.  $155^\circ$  (25). [From  $\beta$ -chloroisocrotonyl chloride (see above) with  $\alpha$ -naphthylamine + excess cold dil. aq.  $\text{NaOH}$  in 100% yield (25).]

MISCELLANEOUS PHYSICAL PROPERTIES OF  $\bar{C}$ 

Polymorphism of  $\bar{C}$ .  $\bar{C}$  is known definitely in the above three  $\alpha$ ,  $\beta$ , and  $\gamma$  forms and perhaps also in a fourth  $\delta$  form, m.p. 43.75° (23), although last could not be confirmed (22) cf. (7). — The stable ( $\alpha$ ) form results from rapid condensation of vapor (23), by crystallization of  $\bar{C}$  from aq. soln. (23), or from rapid cooling of fused  $\bar{C}$  (37), although last method could not be confirmed (25); it is also obtained from the  $\beta$  form by seeding with  $\alpha$  (9) or from  $\gamma$  form by spontaneous transformation (20), or from either  $\beta$  or  $\gamma$  forms at -20° (22).

The  $\beta$  form results from cooling fused  $\bar{C}$  especially if melt is first htd. above 67° cf. (9) (23), or from  $\gamma$  form on stirring (23) (20) (37) (22) cf. (25) (7).

The  $\gamma$  form results from fused  $\bar{C}$  on cooling without stirring (23) (20) (37) (25) (7).

[For study of transformation points of  $\alpha$  and  $\beta$  forms see (21); for studies of effect of pressure on m.p. of  $\bar{C}$  see (38) (39) (25) (8).]

Density and refractive index for fused  $\bar{C}$ . [Values for these constants are *not* in good accord, viz.,  $D_4^{65.4} = 1.3978$  (40),  $D_4^{65} = 1.3703$  (41);  $n_D^{65.4} = 1.4301$  (40),  $n_D^{65} = 1.4297$  (41). — For  $D_4^t$  over range 80°–176° see (36).]

Vapor characteristics. [For study of vapor pressure of  $\bar{C}$  over range 85–180° see (42). — For study of volatility with steam see (43).]

Cryoscopic constant. [Molal f.p. constant for  $\bar{C}$  is 5.2° (for 1000 g.  $\bar{C}$ ) (44) (37); for studies on use of  $\bar{C}$  as cryoscopic solvent see (44) (45) (46) (47).]

Association of  $\bar{C}$ . [For studies on extent of association of  $\bar{C}$  in  $C_6H_6$  soln. at 30° (11), in *p*-chlorotoluene (3:8287) (48), in liquid HF (49), in ether (33), or in water (1–9.7%  $\bar{C}$ ) (50) see indic. refs.]

Heat of combustion. [For studies on heat of combustion of  $\bar{C}$  see (51) (52) (53) (54) cf. (55).]

Exchange reactions. [For study of behavior of  $\bar{C}$  with  $D_2O$  see (56); with  $H_2O^{18}$  see (57).]

Adsorption of  $\bar{C}$  by various adsorbents. [For studies on adsorption of  $\bar{C}$  from aqueous solns. by various forms of carbon (58) (59) (60) (61) (62) (63) (64), by silica gel (60), by synthetic resins (65), by aniline black (66), by filter paper (67), by hide powder (68), by viscose (69), by  $Zr(OH)_2$  (70), or by  $Fe(OH)_3$  (71) see indic. refs.]

[For studies on adsorption of  $\bar{C}$  from nonaqueous solvents by wood charcoal (72) or from aqueous alc. by charcoal (73) or by casein (74) see indic. refs.]

Distribution of  $\bar{C}$  between solvents. [For data on distribution of  $\bar{C}$  between *aq.* and *ether* at 18° (75) or at 25° (76) (77) cf. (81); between *aq.* and *benzene* at 25° (78) or at an unstated temp. (79); between *aq.* and *toluene* at 25° (78) (80); between *aq.* and *isobutyl alcohol* at 25° (80); between *aq.* and *n-amyl alcohol* at 25° (80); between *aq.* and *isoamyl alcohol* at 25° (80); between *aq.* and *di-n-butyl ether* at 25° (5); between *aq.* and *olive oil* at 25° and 37.5° (82) see indic. refs.]

[For data on distribution of  $\bar{C}$  between *aq.* and *nitrobenzene* at 25° (80); between *aq.* and *mixts. of benzene + nitrobenzene* (83); between *aq.* and *o-nitrotoluene* at 25° (80) (84) see indic. refs.]

[For data on distribution of  $\bar{C}$  between *aq.* and  $CHCl_3$  (3:5050) at 25° (80) (85) (86); between *aq.* and  $CCl_4$  (3:5100) at 25° (80) (87) (85); between *aq.* and  $EtBr$  at 25° (80) (77); between *aq.* and  $CHBr_3$  at 25° (85); between *aq.* and  $MeI$  at 25° (80) (87) see indic. refs.]

[For data on distribution of  $\bar{C}$  between *aq.* and  $CS_2$  at 25° (85); between *aq.*  $MgSO_4$  or  $K_2SO_4$  solns. and *di-n-butyl ether* at 25° (88) (5); between *acetone* and *glycerol* at 25° (89) see indic. refs.]

BINARY SYSTEMS CONTAINING  $\bar{C}$ 

Azeotropic systems. [ $\bar{C}$  with *mesitylene* (1:7455) forms a const.-boilg. mixt., b.p. 162° at 760 mm., contg. 17 wt. %  $\bar{C}$  {90};  $\bar{C}$  with *naphthalene* (1:7200) forms a const.-boilg. mixt., b.p. 187.1° at 760 mm., contg. 78 wt. %  $\bar{C}$  {91};  $\bar{C}$  with *o-cresol* (1:1400) forms a const.-boilg. mixt., b.p. 187.5° at 760 mm., contg. 54 wt. %  $\bar{C}$  {91}.]

[ $\bar{C}$  with 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) forms a const.-boilg. mixt., b.p. 146.25° at 760 mm., contg. 1.8 wt. %  $\bar{C}$  {91};  $\bar{C}$  with pentachloroethane (3:5880) forms a const.-boilg. mixt., b.p. 158.65° at 760 mm., contg. 9.9 wt. %  $\bar{C}$  {91};  $\bar{C}$  with hexachloroethane (3:4835) forms a const.-boilg. mixt., b.p. 171.2° at 760 mm., contg. 25 wt. %  $\bar{C}$  {27};  $\bar{C}$  with 1,2,3-trichloropropane (3:5840) forms a const.-boilg. mixt., b.p. 154.5° at 760 mm., contg. 10 wt. % {92}.]

[ $\bar{C}$  with *p-dichlorobenzene* (3:0930) forms a const.-boilg. mixt., b.p. 167.55° at 760 mm., contg. 24.5 wt. %  $\bar{C}$  {27};  $\bar{C}$  with benzal (di)chloride (3:6327) forms a const.-boilg. mixt., b.p. 189.1° at 760 mm., contg. 97 wt. %  $\bar{C}$  {93}.]

[ $\bar{C}$  with *bromobenzene* forms a const.-boilg. mixt., b.p. 154.3° at 760 mm., contg. 11 wt. %  $\bar{C}$  {90};  $\bar{C}$  with *p-dibromobenzene* forms a const.-boilg. mixt., b.p. 186.3° at 760 mm., contg. 75 wt. %  $\bar{C}$  {93}.]

OTHER PHYSICAL DATA ON BINARY SYSTEMS CONTAINING  $\bar{C}$ 

$\bar{C}$  + aq. [ $\bar{C}$  is very eas. sol. aq. {32}; for study of hydration at low temps. see {94}; for f.p./compn. data see {23}. — Data on density of aq.  $\bar{C}$  is fragmentary but for  $D_{20}^{20}$  {40},  $D_{25}^{25}$  {95}, and  $D_{35}^{35}$  {95} for certain concns. see indic. refs. (cf. {96} {97} {98}). — For refractive indices of aq. solns. of  $\bar{C}$  see {20} {40} — For study of soly. of aq. in  $\bar{C}$  +  $C_6H_6$  see {103}.]

$\bar{C}$  +  $H_2SO_4$ . [For densities, viscosities, and elec. conductivity nt 20°, 40°, and 60° over whole compn. range see {12}; for f.p./compn. data over range 46–100%  $\bar{C}$  (no compound is formed) see {18}.]

$\bar{C}$  + acetic acid. (1:1010) [For f.p./compn. data and diag., eutectic m.p. -4.0°, contg. 22 mole %  $\bar{C}$ , see {99} cf. {100} {103} ]

$\bar{C}$  + dichloroacetic acid (3:6208). [For f.p./compn. data {100}, eutectic m.p. -10.5° contg. 30.7 mole %  $\bar{C}$  {101}, see indic. refs.]

$\bar{C}$  + trichloroacetic acid (3:1150). [For f.p./compn. data {100}, eutectic m.p. 17.5° contg. 48.5 mole %  $\bar{C}$  {101}, see indic. refs.]

$\bar{C}$  + miscellaneous organic compds. of Order 1. [For f.p./compn. data on following systems see indic. refs:  $\bar{C}$  +  $C_6H_6$  (1:7400) {103};  $\bar{C}$  + *naphthalene* (1:7200) {99} {17} {20};  $\bar{C}$  + *phenol* (1:1420) {17} {16} {102};  $\bar{C}$  + *o-cresol* (1:1400) {16} {102};  $\bar{C}$  + *m-cresol* (1:1730) {16};  $\bar{C}$  + *p-cresol* (1:1410) {16};  $\bar{C}$  +  $\alpha$ -*naphthol* (1:1500) {16};  $\bar{C}$  +  $\beta$ -*naphthol* (1:1540) {16};  $\bar{C}$  + *thymol* (1:1430) {16};  $\bar{C}$  + *guaiacol* (1:1405) {16};  $\bar{C}$  + *cetyl alc.* (1:5915) {99};  $\bar{C}$  + *meso-crythritol* (1:5825) {14};  $\bar{C}$  + *benzoic acid* (1:0715) {100};  $\bar{C}$  + *o-toluic acid* (1:0690) {100};  $\bar{C}$  + *m-toluic acid* (1:0705) {100};  $\bar{C}$  + *p-toluic acid* (1:0795) {100};  $\bar{C}$  + *phenylacetic acid* (1:0665) {100};  $\bar{C}$  + *cinnamic acid* (1:0735) {100};  $\bar{C}$  + *crotonic acid* (1:0425) {100};  $\bar{C}$  + *dimethyl oxalate* (1:0415) {103};  $\bar{C}$  + *dimethyl succinate* (1:3556) {103};  $\bar{C}$  + *methyl cinnamate* (1:2090) {103};  $\bar{C}$  + *phenyl salicylate* ("Salol") (1:1415) {99};  $\bar{C}$  + *piperonal* (1:0010) {99} {101};  $\bar{C}$  + *vanillin* (1:0050) {101};  $\bar{C}$  + *acetophenone* (1:5515) {101};  $\bar{C}$  + *benzil* (1:0015) {101};  $\bar{C}$  + *dibenzalacetone* (1:9021) {101} ]

$\bar{C}$  + miscellaneous compounds of Order 2. [For f.p./compn. data on following system see indic. refs.:  $\bar{C}$  + *urea* {19};  $\bar{C}$  + *ethyl carbamate* (urethane) {19}.]

TERNARY SYSTEMS CONTAINING  $\bar{C}$ 

[For f.p./compn. data and diag. of following systems see indic. refs.:  $\bar{C}$  ( $\alpha$ -form) + phenol (1:1420) + naphthalene (1:7200) (17);  $\bar{C}$  ( $\beta$  form) + phenol (1:1420) + naphthalene (1:7200) (17).]

USE OF  $\bar{C}$  IN FOODS AND BEVERAGES

**General.** [For discussion of use of  $\bar{C}$  as fermentation and oxidn. inhibitor or stabilizer in fruit juices, carbonated beverages, etc. (sometimes as "Esterex" (106)), see (106) (107) (108) (109) (110); for study of persistence of  $\bar{C}$  in such use see (111); for patents on such use see (112); for studies of bactericidal action (113) or fungistatic props. (114) of  $\bar{C}$  see indic. refs.]

**Toxicity of  $\bar{C}$ .** [For studies on toxicity of  $\bar{C}$  see (115) (116).]

**Detection and determination of  $\bar{C}$  in foods and beverages.** [For studies on detection and detn. of  $\bar{C}$  in commercial preservatives (624), in non-alc. beverages (117) (118) or in wines (119) (120) cf. (117) see indic. refs.; for identification of  $\bar{C}$  as  $Ba\bar{A}_2$  (optical and crystallographic props.) see (121) (623).]

PREPARATION OF  $\bar{C}$ 

**From acetic acid.** [For prepn. of  $\bar{C}$  from acetic acid (1:1010) by chlorination at 250-500° without cat. (625), with  $Cl_2$  in sunlight (32), in light from Hg quartz lamp (122), in silent electric discharge (123), or more usually in presence of catalysts (123) (124) (125) especially sulfur (124) (126) (127) (128) (129), red P (123) (124) (130), iodine (124), mixtures of red P +  $PCl_5$  +  $I_2$  (123) (124) (125) (131) (132) (133) (134), or in acetic anhydride (138) (139) at 100° or in vapor phase over  $NiCl_2$  at 350° (140) see indic. refs.]

[For prepn. of  $\bar{C}$  from acetic acid (1:1010) by chlorination with  $SO_2Cl_2$  at 115-120° and 4-5 atm. press. (135) or in pres. of a little acetyl chloride (136) or in presence of dibenzoyl peroxide in  $CCl_4$  (70% yield (137)) see indic. refs.; for formn. of  $\bar{C}$  from  $AcOH$  +  $HCl$  on electrolysis see (141).]

**From trichloroethylene.** [For prepn. of  $\bar{C}$  from trichloroethylene (3:5170) with conc.  $H_2SO_4$  at 190-195° see (142) (143) (144) (145) (146); for patents on this process see (147) (148) (149) (150) (151) (152) (153) (154). — Note also that  $H_2SO_4$  may be replaced by arom. sulfonic acids such as benzenesulfonic acid see (155). — Note also that a very similar process (156) starting from unsym.-tetrachloroethane (3:5555) doubtless first involves loss of  $HCl$  to trichloroethylene.]

**From other chloro-compounds.**  $\bar{C}$  is also formed by appropriate oxidation of many suitably constituted chloro-compounds [e.g., for formn. of  $\bar{C}$  from 1,2-dichloroethane (ethylene (di)chloride) (3:5130) with dry  $O_2$  in u.v. light see (157)].

[For formn. of  $\bar{C}$  by oxidation of unsaturated chloro-compds. see the following examples: 1,2-dichlorobutene-2, low-boilg. isomer (3:5360), high-boilg. isomer (3:5615) with  $KMnO_4$  in acetone (158); 1,4-dichlorobutene-2 (3:5725) with  $KMnO_4$  or  $O_3$  (159); 1,2,4-trichlorobutene-2 (3:9062) with aq.  $KMnO_4$  (160); 1,4-dichloro-2-methylbutene-2 (3:9204) with  $O_3$  followed by  $KMnO_4$  (161); 4-chlorobutadiene-1,2 (3:7225) with aq. alk.  $KMnO_4$  (162); 1,3-dichlorohexadiene-2,4 (3:9310) with aq.  $KMnO_4$  (163); 3,3,6-trichlorohexadiene-1,4 (3:9308) with aq.  $KMnO_4$  (164); 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306) with aq.  $KMnO_4$  (164); 3,6-dichlorohexatriene-1,3,4 (3:9304) with aq.  $KMnO_4$  (164); 1-chloro-5-methoxypentadiene-2,3 with aq.  $KMnO_4$  (165); ethyl 5-chloropenten-3-oate with aq.  $KMnO_4$  (166); 1-chloro-5-methoxy-5-phenylpentene-2 with  $KMnO_4$  in acetone (35); chloroacetylene (3:7000) with  $NaOCl$  (167).]

[For formn. of  $\bar{C}$  from ethylene chlorohydrin (3:5552) by oxidn. with  $CrO_3$  (168); from

1-chloropropanol-2 (propylene  $\alpha$ -chlorohydrin) (3:7747) by oxidn. with  $\text{HNO}_3$ ; from 1,3-dichloropropanol-2 ("  $\alpha$ -dichlorohydrin ") (3:5985) by oxidn. with conc.  $\text{HNO}_3$  (169) cf. (170) see indic. refs.]

[For formn. of  $\bar{\text{C}}$  from chloroacetaldehyde (3:7212) by oxidn. with conc.  $\text{HNO}_3$  (171) cf. (172),  $\text{AgOH}$  (172) or dil.  $\text{H}_2\text{O}_2$  (173); from chloroacetone (3:5425) by oxidn. with  $\text{KMnO}_4$  (161) (174),  $\text{CrO}_3$  (174),  $\text{HNO}_3$  (174), (175); from 1-chlorohutanone-2 (3:8012) by oxidn. with  $\text{HNO}_3$  (176) (177) see indic. refs.]

From aminoacetic acid (glycine). [For formn. of  $\bar{\text{C}}$  from glycine with nitrous acid (40% yield (178)), with conc.  $\text{HCl}$  + conc.  $\text{HNO}_3$  (179), or from glycine hydrochloride with satd. aq.  $\text{MgCl}_2$ ,  $\text{CaCl}_2$ , or  $\text{ZnCl}_2$  +  $\text{NaNO}_2$  (180), see indic. refs.]

From miscellaneous sources. [For prepn. of  $\bar{\text{C}}$  from ketene with  $\text{Cl}_2$  in gas phase,  $\text{CCl}_4$ , or dry ether, followed by nq. (181); from ketene with nq.  $\text{Ca}(\text{OCl})_2$  (182); from formaldehyde +  $\text{CO}$  +  $\text{HCl}$  gas nt  $180^\circ$  and 800-900 atm. (183), for formn. of  $\bar{\text{C}}$  from  $\alpha$ -trioxymethylene with  $\text{SO}_2\text{Cl}_2$  in pres. of  $\text{ZnCl}_2$  or  $\text{AlCl}_3$  in s.t. at  $150^\circ$  for 12 hrs (2); from methyl formate (1:1000) with  $\text{SO}_2\text{Cl}_2$  in s.t. at  $165$ - $170^\circ$  (2); from ethylene with  $\text{ClO}_2$  (184); from nitro-trichloromethane ("chlorpicrin") in  $\text{AcOH}$  on exposure to light (185) cf. (186) (187) (188) ]

[For formn. of  $\bar{\text{C}}$  from  $\alpha,\beta$ -dichlorovinyl ethyl ether (3:5540) on boilg. with excess aq. see (189) (note, however, that with calcd. amt. nq. ethyl chloroacetate (3:5700) results (190)); for formn. of  $\bar{\text{C}}$  from unsym.-tetrachloroacetone (3:6085) by hydrolytic cleavage with aq.  $\text{KOH}$  see (191).]

[For formation of  $\bar{\text{C}}$  from its own derivatives, e.g., chloroacetyl chloride (3:5235), chloroacetic acid anhydride (3:0730), methyl chloroacetate (3:5585), ethyl chloroacetate (3:5700), or other esters, etc., see these compds.]

## CHEMICAL BEHAVIOR OF $\bar{\text{C}}$

### PYROLYSIS OF $\bar{\text{C}}$

[ $\bar{\text{C}}$  on distn. through a red-hot tube decomposes giving (192)  $\text{HCl}$  +  $\text{CO}$  +  $\text{CH}_2\text{O}$  (1:0145) + sym.-dichlorodimethyl ether (3:5245). —  $\bar{\text{C}}$  at  $250$ - $340^\circ$  over  $\text{ThO}_2$ , kuoilin, or animal charcoal gives (193)  $\text{HCl}$  +  $\text{CO}$  +  $\text{CO}_2$ , but  $\bar{\text{C}}$  merely boiled with activated carbon undergoes no decomposition (194).]

[ $\bar{\text{C}}$  on htg. in tertiary bases such as dimethylaniline (195) or pyridine (196) decomposes into  $\text{CO}_2$  +  $\text{MeCl}$  (3:7005), undoubtedly by way of formn. and decmpn. of intermediate quaternary ammonium compds. (betaines) (196).]

[ $\bar{\text{C}}$  in dry ether or  $\text{C}_6\text{H}_6$  soln. on exposure to ultra-violet light decomposes giving (197)  $\text{HCl}$  + fumaric acid (1:0895) + a substance which on shaking with nq. yields glycolide (1:0667).]

### REDUCTION OF $\bar{\text{C}}$

[ $\bar{\text{C}}$  on reduction in nq. or aq. alc. alk. with  $\text{H}_2$  in pres. of  $\text{Pd}$  or  $\text{Ni}$  (198) (199) (200), or  $\bar{\text{C}}$  with chromous sulfate (201), or  $\bar{\text{C}}$  with finely divided  $\text{Fe}$  (202), or  $\bar{\text{C}}$  in nq.  $\text{EtOH}$  in ultra-violet light (203), or  $\bar{\text{C}}$  on electrolytic reduction (204) gives acetic acid (1:1010). — Note, however, that attempts to effect bimolecular hydrogenation of  $\bar{\text{C}}$  to succinic acid have been unsuccessful (205).]

### OXIDATION OF $\bar{\text{C}}$

[ $\bar{\text{C}}$  on oxidn. with  $\text{K}_2\text{S}_2\text{O}_8$  gives (206) methylene (di)chloride (3:5020); for study of oxidn. of  $\bar{\text{C}}$  to  $\text{CO}_2$  with  $\text{K}_2\text{S}_2\text{O}_8$  see (207). —  $\bar{\text{C}}$  (as  $\text{NaA}$ ) on electrolysis gives (208) cf. (209) methylene (di)chloride (3:5020), chloromethyl chloroacetate [Beil. II-198, II-2-

(193)], and other prods. — For study of photochemical oxidn. of  $\bar{C}$  with  $KMnO_4$  in pres. of uranyl salts see (210).]

### REACTIONS INVOLVING SUBSTITUTION OF H ATOMS OF ALKYL RADICAL OF $\bar{C}$

**Fluorination.** The behavior of  $\bar{C}$  with  $F_2$  appears not to have been studied: chloro-fluoroacetic acid is unknown; chloro-difluoroacetic acid [Beil. II-201] although known has been prep'd. from difluoroacetic acid by chlorination.

**Chlorination.** [ $\bar{C}$  with  $Cl_2$  (211) in pres. of  $I_2$  (212) gives dichloroacetic acid (3:6206) very likely accompanied by some trichloroacetic acid (3:1150).]

**Bromination.** [ $\bar{C}$  with  $Br_2$  at  $160^\circ$  is claimed (213) to give chloro-bromo-acetic acid [Beil. II-217, II<sub>2</sub>-(204)], but this is best prepared by other means, e.g., from  $\alpha,\beta$ -dichloro-vinyl ethyl ether (3:5540) by addn. of  $Br_2$ , conversion by distn. to chloro-bromo-acetyl chloride, and hydrolysis (214) (41) (215) (216). — Note that although dibromination of  $\bar{C}$  to chloro-dibromo-acetic acid [Beil. II-220] appears unreported, yet this product is obt'd. by other means cf. (217).]

**Sulfonation.** [ $\bar{C}$  with  $ClSO_3H$  on warming (218) or  $\bar{C}$  with  $SO_3$  finally at  $70^\circ$  (219) cf. (220) gives sulfo-chloroacetic acid [Beil. III-598, III<sub>1</sub>-(208), III<sub>2</sub>-(387)], hygroscopic ndls. of monohydrate from aq., m.p.  $83^\circ$  (219) (corresp. bis-acid chloride, oil, b.p.  $70^\circ$  nt 3 mm.,  $D^{15}_D = 1.669$ ,  $n^{23}_D = 1.4920$  (121); corresp.  $N,N,N',N'$ -tetraphenyldiamide, m.p.  $210^\circ$  (121)), accompanied (218) (220) by some chloromethanedisulfonic acid (chloromethionic acid) [Beil. II-25]. — For resolution of *d,l*-sulfochloroacetic acid see (219).]

**Miscellaneous substitution reactions.** [ $\bar{C}$  (as  $K\bar{A}$ ) on heig. with  $Hg$  gives (222) the salt of chloromercuri-chloroacetic acid which with either acid or alk. gives glycolic acid (1:0430).]

### REACTIONS INVOLVING THE $-COOH$ GROUP OF $\bar{C}$

#### Acidic Strength of $\bar{C}$

$\bar{C}$  behaves as a very strong monobasic acid; Neut. Eq. = 04.5. — [Ionization const. of  $\bar{C}$  in aq. nt  $25^\circ$  is  $1.55 \times 10^{-3}$  (223) (224),  $1.51 \times 10^{-3}$  (224) (225),  $1.396 \times 10^{-3}$  (226),  $1.378 \times 10^{-3}$  (227). — For examples of other studies of ioniz. const. of  $\bar{C}$  in aq. see (228) (229); for study of temp. variation of ioniz. const. in aq. over range  $0-40^\circ$  see (227) (230); for  $H^+$  conc. of  $\bar{C}$  in aq. solns. (75), in aq. solns. of  $KCl$  or  $NaCl$  (231) (234), or in buffer mixts. of  $\bar{C} + Na\bar{A}$  (232) (233); for studies of elec. conductivity of  $\bar{C}$  in aq. soln. at  $0^\circ$  (235), at  $60^\circ$  (236), at  $62.5^\circ$  (45), or over range  $0-78^\circ$  (4) see indic. refs. — For discussion of resonance and acid strength of  $\bar{C}$  see (237) (238) (239). — For study of "sourness" of  $\bar{C}$  from taste aspect see (252).]

[Studies of acid strength of  $\bar{C}$  in other solvents include the following: in  $EtOH$  (240) (241), in *n*- $BuOH$  (24) (242), in 60% methyl "cellosolve" (ethylene glycol monomethyl ether) (243), in *m*-cresol (242), in ether (244), in formamide (245), in acetonitrile (246), in  $C_6H_6$  (247), in chlorobenzene (248), or in  $CHCl_3$  (244). — For studies on electrometric titration of  $\bar{C}$  in  $C_6H_6$  (249), or use of indicators with  $\bar{C}$  in  $C_6H_6$  soln. (250), see indic. refs. — For studies of elec. conductivity of  $\bar{C}$  in  $MeOH$ ,  $EtOH$ ,  $BuOH$ , acetone see (251).]

#### Catalytic Effect of $\bar{C}$ upon Various Reactions

The catalytic influence of  $\bar{C}$  upon diversified types of chem. reaction has been extensively examined; although this matter cannot be recorded exhaustively, the following examples are cited.

[For studies of catalytic effect of  $\bar{C}$  upon the inversion of *l*-menthone to *d*-isomenthone in  $C_6H_6$  (253) or in chlorobenzene (254); upon racemization of methyl-phenyl-acetophenone

and of isobutyl-phenyl-acetophenone in various solvents (255); upon  $I_2$ /acetone reaction (224) (234) (256) (257) (232); upon hydrogen disproportionation of limonene (622) see indic. refs.]

[For studies of catalytic effect of  $\bar{C}$  upon the hydrolysis of ethyl formate in neutral salt solns. at 25° (258); of EtOAc (259) (235) in pres. of Na $\bar{A}$  or NaCl (259) (225); of sucrose (260) (261) see indic. refs.]

[For studies of catalytic effect of  $\bar{C}$  upon formn. of ether from ethyl alcohol (262); upon depolymerization of paraldehyde (273) or of dimeric dihydroxyacetone (263); upon bromination of ethyl acetoacetate (264) see indic. refs.]

[For studies on catalytic effect of  $\bar{C}$  upon nitration of toluene (265) (266); upon decompn. of ethyl diazoacetate in  $C_6H_6$  (253) (267); upon decompn. of nitramide (268); upon rearr. of *N*-chloroacetanilide in chlorobenzene soln. at 100° (269); upon rearr. of *N*-bromoacetanilide in chlorobenzene,  $C_6H_6$ , or ethylene (di)chloride (270); upon rearr. of *N*-iodoformanilide in anisole (271); upon rearr. of *N*-bromobenzanilide in chlorobenzene at 25° (272) see indic. refs.]

### *Salts of $\bar{C}$*

This topic cannot be exhaustively treated here but following examples are cited.

Salts with inorganic bases. [NH $\bar{A}$ , from  $\bar{C}$  in abs. alc. with dry NH $_3$  gas (274). — Hydroxylamine salt, HONH $\bar{A}$ , cryst. from boilg. alc., m p. 124–125° (275).]

[Na $\bar{A}$  on electrolysis gives (203) (209) methylene (di)chloride (3:5020), chloromethyl chloroacetate [Beil. II-198, II- (193)], and other prods.; on htg. gives (276) polyglycolid, for rate of decompn. by aq. see (277). — K $\bar{A}$ , 3H $_2$ O (32); K $\bar{A}$  1/2H $_2$ O (32) (277) (for study of rate of decompn. by aq. see (277)); K $\bar{A}$ . $\bar{C}$ , sparingly sol. aq. (32). — Ag $\bar{A}$ , spar. sol. cold aq., more readily in hot aq. (32); for soly. in HNO $_3$  see (278); dry htg. gives (270) AgCl + polyglycolid; on htg. with a little aq. gives (279) AgCl + glycolic acid; for prepn. and study of activity coefficient in pres. of electrolytes see (280); for sensitivity to light see (281).]

[Ba $\bar{A}$ , see (293); Mg $\bar{A}$ .2H $_2$ O, very sol. aq. or alc. (277); Ca $\bar{A}$ .H $_2$ O, very sol. aq. or alc. (277) (for use in eel worm control in soil see (282)); Sr $\bar{A}$ , spar. sol. aq. alc. (277); Ba $\bar{A}$ .H $_2$ O (32) (277) (293) (for use in detn. of  $\bar{C}$  see (121) (623)); Cu $\bar{A}$ .4H $_2$ O (274), Cu $\bar{A}$ .3H $_2$ O (283), Cu $\bar{A}$ .2 (274) cf. (284); for study of electrolysis see (285); for dissoc. see (288); for various complexes with Ni $f_2$  and amines see (286) (287). — Zn $\bar{A}$ .2(47)H $_2$ O (274). — Cd $\bar{A}$ .6H $_2$ O, for prepn. (289), crystallography (290), dissociation (285), and conductivity (291) see indic. refs. — Pb $\bar{A}$ , spar. sol. cold aq. (274). — Hg $\bar{A}$ , spar. sol. aq. (292). — Hg $_2$  $\bar{A}$ , spar. sol. aq. (292).]

[Al $\bar{A}$ , see (293). — Mn $\bar{A}$ . $\bar{C}$ .H $_2$ O (274); Mn $\bar{A}$ . $\bar{C}$ .2H $_2$ O (274); Mn $\bar{A}$ .1.5H $_2$ O (289). — Co $\bar{A}$ .6H $_2$ O, m.p. 68–69° (289), for study of complexes with pyridine see (294). — Ni $\bar{A}$ .3H $_2$ O (274), for complexes with various amines see (295). — For studies on complexes of  $\bar{C}$  with iron salts see (274) (296) (297).]

Salts with organic bases (amines). [Aniline chloroacetate, m p. 88° (298) (best from  $\bar{C}$  in dry ether treated dropwise with aniline in dry ether with cooling (299); note that this salt with P $_2$ O $_5$  on stdg. gives (299) *o*-chloroacetanilide, m p. 136° cor.). — *o*-Toluidine chloroacetate, m.p. 95° (300). — *p*-Toluidine chloroacetate, m.p. 97.5° (300) (note that this salt at 80–90° for 2 hrs. (301) or with P $_2$ O $_5$  (302) gives chloroaceto-*p*-toluidide, m.p. 164° (302)).]

*o*-Phenylethylamine chloroacetate, from  $\bar{C}$  + base in EtOAc, m.p. 93.6–94.4° u.c., 91.7–93.5° cor. (303). — Benzylamine chloroacetate, from  $\bar{C}$  + base in EtOAc, m.p. 118.4–119.4° u.c., 119.0–120.9° cor. (303) (note that this m.p. is practically identical with corresponding benzylamine salt of trichloroacetic acid (3:1150) q.v.). — Piperazine bis-(chloroacetate), m.p. 145–146° cor. (304). — Semicarbazide chloroacetate, m.p. 111–112° (305).

*Phenylhydrazine chloroacetate*, from  $\bar{C}$  with phenylhydrazine in  $C_6H_6$ , m.p.  $111^\circ$  (306) (note that this product is definitely the salt since on titration with alk. it gives Neut. Eq. 204.7 as against calcd. value of 202.6 (306); however, during detn. of m.p. it is undoubtedly converted to chloroaceto-phenylhydrazide, m.p.  $115^\circ$  (307), directly obtd. from chloroacetyl chloride (3:5235) with phenylhydrazine in ether (307)).

### *Behavior of Acidic Hydrogen of $\bar{C}$ with Metals*

[For study of rate of soln. of Mg in aq. solns. of  $\bar{C}$  see (308); for behavior of  $\bar{C}$  with Zn see (309); for study of 20% aq. solns. of  $\bar{C}$  on silver see (310).]

### *Esterification of $\bar{C}$*

This book includes the following esters of  $\bar{C}$  under their own individual numbers q.v.: *methyl chloroacetate* (3:5585), *ethyl chloroacetate* (3:5700), *n-propyl chloroacetate* (3:0565), *isopropyl chloroacetate* (3:8160), *n-butyl chloroacetate* (3:8530), *isobutyl chloroacetate* (3:8375), *sec-butyl chloroacetate* (3:8350), *ter-butyl chloroacetate* (3:8220), *ethylene glycol (mono)-chloroacetate* (3:6780), *ethylene glycol bis-(chloroacetate)* (3:0720),  *$\beta$ -methoxyethyl chloroacetate* (3:0285), *diethylene glycol (mono)chloroacetate* (3:9390), *triethylene glycol (mono)-chloroacetate* (3:0583), and *phenyl chloroacetate* (3:0565).

[For studies of rate of esterification of  $\bar{C}$  under various conditions with MeOH (1:6120) (311) (312) (313) (314) (315), with EtOH (1:6130) (312) (313) (1) (316) (317) (318), with isobutyl alc. (1:6165) (310) (320), with amyl alc. (313), or with neopentyl alc. (1:5812) (321) see indic. refs. — For studies on esterification of  $\bar{C}$  with alcohols by  $BF_3$  method (312) (322) or without cat. (328) see indic. refs.]

[For patents involving esterification of  $\bar{C}$  with alcs. (323) by use of  $Cl_2$  (324) see indic. refs.]

[For study of use of  $\bar{C}$  in esterification of various carbohydrate derivs. (325) or of cellulose (320) cf. (327). — Note that the chemistry of poly (vinyl chloroacetate) cannot be considered here.]

### *Addition Reactions of $\bar{C}$ with Organic Compounds*

**Addition to unsaturated linkages.**  $\bar{C}$  in presence of suitable cat. adds to unsaturated linkages giving the corresp. esters [e.g.,  $\bar{C}$  with propylene +  $BF_3$  at  $60-70^\circ$  gives (34.2% yield (329)) isopropyl chloroacetate (3:8160);  $\bar{C}$  with butene-2 +  $ZnCl_2$  at  $100^\circ$  for 8 hrs. gives (330) *sec*-butyl chloroacetate (3:8350); similarly  $\bar{C}$  with pentene-2 (1:8215) gives (330) diethylcarbinyl chloroacetate, b.p.  $177-178^\circ$ . — Note, however, that no record can be found of reaction of  $\bar{C}$  with ethylene to give ethyl chloroacetate (3:5700)].

[ $\bar{C}$  with *n*-butylacetylene (hexyne-1) (1:8055) in pres. of  $HgO$  + MeOH +  $BF_3 \cdot Et_2O$  gives (68% yield (331)) 2-(chloroacetoxy)hexene-1, b.p.  $100-101^\circ$  at 20 mm.,  $D_{25}^{25} = 1.017$ ,  $n_D^{25} = 1.4453$  (331). (For addition of  $Br_2$  to this prod. giving 67% yield 1-bromohexanone-2 + 21% yield chloroacetyl bromide see (334)).]

**Addition to epoxy compounds.** [ $\bar{C}$  with ethylene oxide (1:6105) in dry ether at  $0^\circ$  for 4 days (332) or at  $50^\circ$  under press. for 0 days (333) gives ethylene glycol mono(chloroacetate) (3:6780).]

### *Conversion of $\bar{C}$ to Corresponding Acyl Halides*

**Conversion of  $\bar{C}$  to chloroacetyl fluoride.** [ $\bar{C}$  on distn. with fluorosulfonic acid (335) or  $\bar{C}$  with  $KF$  + benzoyl chloride (3:6240) (336) gives (yields: 30% (336), 15% (335)) chloroacetyl fluoride, h.p.  $74^\circ$  (335),  $74-76^\circ$  (336).]

**Conversion of  $\bar{C}$  to chloroacetyl chloride.** [ $\bar{C}$  can by numerous methods be converted

to chloroacetyl chloride (3:5235) q.v. — Note also, however, that  $\bar{C}$  with large excess  $PCl_5$  (4 moles) gives (337) tetrachloroethylene (3:5460) and other products.]

Conversion of  $\bar{C}$  to chloroacetyl bromide. [ $\bar{C}$  with  $Br_2$  + red P (338) (339) or with  $PBr_3$  (340) gives chloroacetyl bromide, b.p.  $127^\circ$  (338) (340),  $D_4^{20} = 1.840$  (340).]

#### *Conversion of $\bar{C}$ to Corresponding Anhydride*

$\bar{C}$  can by numerous methods be converted to chloroacetic acid anhydride (3:0730) q.v.

### REACTIONS INVOLVING THE CHLORINE ATOM OF $\bar{C}$

#### *Reduction of $\bar{C}$*

See above as second heading under *chemical behavior of  $\bar{C}$* .

#### *Hydrolysis of $\bar{C}$ (or its salts)*

Hydrolysis of  $\bar{C}$  to glycolic (hydroxyacetic) acid (1:0430) together with the form. under certain conditions of diglycolic acid (1:0495) has been very extensively studied.

Hydrolysis of  $\bar{C}$  (or its salts) with aq.  $\bar{C}$  on protracted boilg. with aq. (341) (342) (343) or  $\bar{C}$  (as  $Na\bar{A}$  or  $K\bar{A}$ ) on boiling with aq. (32) (344) (277) or  $\bar{C}$  with aq.  $BaCO_3$  (followed by pptn. of barium with  $H_2SO_4$  (345)) gives (88.7% yield (345)) glycolic acid (1:0430).

[For studies on rate of hydrolysis of  $\bar{C}$  by aq. under various conditions (326) (342) (343) (346) (347) (348) (349) (350) (351), for study of influence of ultra-violet light (352) (353) (354) (355); for influence of temperature (356); for study of ord. and in heavy aq. (357); for heat of hydrolysis with aq. (358); for study of abnormalities of hydrolysis of salts (359); for study of induction period of hydrolysis (360) (383); for acceleration of hydrolysis by colloidal  $Ag$ ,  $Ag_2O$ , or  $CuO$  (349) see indic. refs.]

[For studies of quantum yields of hydrolysis of  $\bar{C}$  and use as standard see (361) (362) (363) (364) (365) (366) (367) (353).]

Hydrolysis of  $\bar{C}$  (or its salts) with alkalis.  $\bar{C}$  on hydrolysis with aq. alkalis also gives glycolic acid (1:0430) [for studies of this reaction see (368) (342) (340) (369) (370) (350) (371) (351) (372) (373); for studies of hydrolysis of  $Na\bar{A}$  by salts of weak acids (374), for study of basic catalysts (375), for effect of high press. (376) see indic. refs.]

[For patents on conversion of  $\bar{C}$  to glycolic acid (1:0430) by alkaline hydrolysis see (377) (378); note, however, that the glycolic acid so formed may be converted (379) to glycolid (1:0667).]

Note also that under the influence of the alkaline medium some of the glycolic acid first formed may condense with unreacted  $\bar{C}$  to give diglycolic acid (1:0495); for studies of this aspect of the reaction see (380) (381) (382).

#### *Behavior of $\bar{C}$ with $NaSH$ or Its Relatives*

[ $\bar{C}$  with aq. 15%  $KSH$  (384) or with freshly prepd. aq. 15%  $NaSH$  (385) at  $95^\circ$  for 1 hr., subsequently acidified with  $H_2SO_4$  and extracted with ether, gives (99% yield (385)) mercaptoacetic acid (thioglycolic acid) [Beil. III-244, III<sub>1</sub>-(95), III<sub>1</sub>-(175)], b.p.  $107-108^\circ$  at 16 mm. (384) (385), m.p. =  $-16.5^\circ$  (384),  $D_{20}^{20} = 1.3253$  (384) — Note that this prod. is also preparable by many other methods some of which are cited below.]

[ $\bar{C}$  (2 moles) as  $Na\bar{A}$  with  $NaSH$  as directed (386) (387) (388), or as  $K\bar{A}$  with  $KSH$  (389) (390), or as  $Na\bar{A}$  with potassium sulfantimonite (391) or sodium sulfostannate (391), or as  $Ca\bar{A}_2$  with excess  $Ca(SH)_2$  +  $H_2S$  (381) gives (84% yield (387)) thiodiglycolic acid (thiodiacetic acid),  $S(CH_2COOH)_2$  [Beil. III-253, III<sub>1</sub>-(97), III<sub>2</sub>-(178)], cryst. from  $AcOEt/C_2H_5$  (1:9) (388) m.p.  $130^\circ$  (388),  $129^\circ$  (387) (386).]

[ $\bar{C}$  (2 moles) as  $\text{Na}\bar{A}$  with aq.  $\text{Na}_2\text{S}_2$  (392) (393) (394), with alk. or alk.-earth polysulfides (402), with sodium sulfantimonate  $\text{Na}_3\text{SbS}_4$  (391) or sodium sulfarsenate  $\text{Na}_3\text{AsS}_4$  (391) gives dithiodiglycolic acid,  $\text{HOOC}\cdot\text{CH}_2\text{—S—S—CH}_2\cdot\text{COOH}$  [Beil. III-254, III<sub>1</sub>-(97), III<sub>2</sub>-(179)], lfts. from  $\text{AcOEt}/\text{C}_6\text{H}_6$  (1:9) (388) 108–109° (391), 106° (388). — Note that this prod. on reduction gives mercaptoacetic acid (above): e.g., for reduction with  $\text{Sn} + \text{HCl}$  (395), with  $\text{Zn} + \text{H}_2\text{SO}_4$  (393) (396) (401) (402), with  $\text{Na}/\text{Hg}$  (397), by electrolytic reduction in  $\text{H}_2\text{SO}_4$  soln. using  $\text{Pb}$  electrodes (398), by shaking soln. of sodium salt with  $\text{Fe}$  powder at 38° under  $\text{N}_2$  (399), or by shaking with alanine or phenylalanine in 1% soln. in pres. of active carbon at 38° under  $\text{N}_2$  (400) see indic. refs.]

### *Behavior of $\bar{C}$ with Various Salts of Inorganic Acids*

(For behavior with  $\text{NaCN}$ , etc., see further below.)

With halides. [ $\bar{C}$  with  $\text{HBr}\cdot 5\text{H}_2\text{O}$  in a.t. at 150° gives (403) bromoacetic acid [Beil. II-213, II<sub>1</sub>-(95), II<sub>2</sub>-(201)], m.p. 49–50°, b.p. 208°; however,  $\bar{C}$  in aq.  $\text{KBr}$  at 50° shows only very slight tendency to formn. of bromoacetic acid (for study of equilibrium see (404)).]

[ $\bar{C}$  with aq.  $\text{KI}$  at 50° (405) (406), or  $\bar{C}$  with  $\text{NaI}$  in acetone at room temp. (407) (or in ethyl methyl ketone, diethyl ketone, or  $\text{AcOEt}$  (407) but *not* in  $\text{EtOH}$  (408)) gives iodoacetic acid, cryst. from much pet. ether (405) (409), m.p. 83° (405), 82° (406); for study of equilibrium of  $\bar{C}$  with  $\text{KI}$  in aq. at 50° see (404); of  $\bar{C}$  with  $\text{KI}$  or  $\text{NaI}$  in acetone (ionic reaction) see (410).]

With salts of inorganic sulfur, nitrogen, or phosphorus acids. [ $\bar{C}$  with aq.  $\text{Na}_2\text{SO}_3$  gives (41) (412) salts of sulfoacetic acid [Beil. IV-21, IV<sub>1</sub>-(312), IV<sub>2</sub>-(531)]; for study of rate of reaction of  $\text{K}\bar{A}$  with  $\text{Na}_2\text{SO}_3$ ,  $\text{K}_2\text{SO}_3$ , or  $(\text{NH}_4)_2\text{SO}_3$  under various conditions see (214) (413).]

[The salts of  $\bar{C}$  with aq.  $\text{Na}_2\text{S}_2\text{O}_3$  give the corresp. salts of "glycolic acid thiosulfate" (carboxymethyl hydrogen sulfato) [Beil. III-235, III<sub>1</sub>-(97), III<sub>2</sub>-(171)]; for studies of this reaction see (414) (415) (416) (417) (418).]

The alkali salts of  $\bar{C}$  with aq. alkali nitrites give the corresp. alkali salts of nitroacetic acid; in fact from a conc. aq. soln. of the potassium nitroacetate, treatment with the calcd. amt. of conc.  $\text{HCl}$  and extraction with much ether gives (70% yield (419)) (420) free nitroacetic acid [Beil. II-225, II<sub>1</sub>-(99), II<sub>2</sub>-(207)], m.p. 87–89° dec. (420). — However, even aq. solns. of the alkali salts of nitroacetic acid on warming readily lose  $\text{CO}_2$  yielding nitromethane [Beil. I-74, I<sub>1</sub>-(19), I<sub>2</sub>-(40)], b.p. 100.80–100.86° at 760 mm. (421), f.p. –29.2°,  $D_4^{25} = 1.1322$  (421),  $n_D^{25} = 1.38056$  (421), and although this product is now commercially available from other sources, the reaction is of considerable interest in connection with  $\bar{C}$ . — [For studies on the prepn. of nitromethane from  $\text{K}\bar{A} + \text{KNO}_2$  (yield 47% (422)) (423) (424) or from  $\text{Na}\bar{A} + \text{NaNO}_2$  (yields: 70% (428), 58% (426), 53% (429) (430) (431), 35–38% (425)) see indic. refs. — For studies on rate of decompn. of nitroacetic acid in aq. soln. at 20° (432), in  $\text{HCl}$ , or in acetate buffered solns. at 17.84° and 9.78° (433) cf. (434) (435) (436) see indic. refs.]

[The behavior of  $\bar{C}$  with  $\text{NaN}_3$  appears to be unreported; note, however, that ethyl chloroacetate (3:5700) with  $\text{NaN}_3$  gives (437) ethyl azidoacetate [Beil. II-229, II<sub>1</sub>-(101), II<sub>2</sub>-(208)], which upon hydrolysis with aq.  $\text{KOH}$  gives (437) azidoacetic acid.]

[For behavior of  $\bar{C}$  with aq.  $\text{Na}_3\text{PO}_4$  at 85° see (438).]

### *Behavior of $\bar{C}$ with Hydrocarbons*

$\bar{C}$  with certain aromatic hydrocarbons or their halogen derivs. at elevated temp. but without cat. condenses with elimination of  $\text{HCl}$  to give arylated acetic acids [e.g.,  $\bar{C}$  with

*Behavior of  $\bar{C}$  with Salts of Organic Acids*

With NaCN, KCN, etc. [ $\bar{C}$  on conversion to Na $\bar{A}$  and reaction with aq. NaCN (465) (466) (475) (476) or KCN (467) (468) (469) gives (yields: 75% (469), 70% (468)) cyanoacetic acid (malonic acid mononitrile) [Beil. II-583, II<sub>2</sub>-(253), II<sub>2</sub>-(630)], m.p. 69-70° (468), 69° (470), 66.1-66.4° cor. (467), 65-66° (471), 65° (472) (473); for use of this reaction in prepn. of malonic acid (1:0480) see (476).]

Note, however, that the behavior of  $\bar{C}$  or its salts with KSCN, NH<sub>4</sub>SeN, alkali xanthates, etc., is both complex and disputed and cannot be detailed here.

*Behavior of  $\bar{C}$  with NH<sub>3</sub>*

$\bar{C}$  with NH<sub>3</sub> under various conditions gives aminooacetic acid (glycine) [Beil. IV-333, IV<sub>1</sub>-(462), IV<sub>2</sub>-(771)].

[For behavior of  $\bar{C}$  with conc. aq. NH<sub>4</sub>OH as method of prepn. of glycine (yields: 66-69% (477), 64-65% (478), 54% (470), 50% (480)) (481) (482) (486) (for numerous older refs. see Beilstein) see indic. refs.: for extensive studies on influence of conditions on this reaction see (483) (477); for study of rate of ammonolysis of  $\bar{C}$  see (484) (485). — For behavior of  $\bar{C}$  with liq. NH<sub>3</sub> see (487); note that  $\bar{C}$  in liq. NH<sub>3</sub> with Na splits out calcd. amt. NaCl and that no cyanide is formed (488). — For behavior of  $\bar{C}$  with (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub> see (483) (477) (489).]

[Note that reaction of  $\bar{C}$  with NH<sub>3</sub> does not stop with formn. of aminooacetic acid (glycine) but that unchanged  $\bar{C}$  reacts with the latter to give (489) (490) (480) iminodiacetic acid ("diglycolamidic acid") HN(CH<sub>2</sub>COOH)<sub>2</sub> [Beil. IV-365, IV<sub>1</sub>-(481), IV<sub>2</sub>-(800)], and/or trimethylamine- $\alpha,\alpha',\alpha''$ -tricarboxylic acid ("triglycolamidic acid") [Beil. IV-369, IV<sub>1</sub>-(482), IV<sub>2</sub>-(801)], also obtd. from  $\bar{C}$  on fusion with ZnCl<sub>2</sub>/NH<sub>3</sub> (492).]

*Behavior of  $\bar{C}$  with Organic Amines*

With primary aliphatic amines. [ $\bar{C}$  with MeNH<sub>2</sub> as directed (497) gives (methylamino)-acetic acid (*N*-methylglycine = sarcosine) [Beil. IV-345, IV<sub>1</sub>-(468), IV<sub>2</sub>-(784)], but this prod. is usually prepd. in other ways. — Note, however, that  $\bar{C}$  (2 moles) with MeNH<sub>2</sub> (1 mole) + excess aq. NaOH gives (63-71% yield (493)) (494) methyliminodiacetic acid, CH<sub>3</sub>N(CH<sub>2</sub>COOH)<sub>2</sub> [Beil. IV-367, IV<sub>2</sub>-(800)], cryst. from aq. MeOH, m.p. 226-227° dec. (495), 226° dec. (496).]

[ $\bar{C}$  with excess aq. EtNH<sub>2</sub> as directed (498) gives ethylaminoacetic acid (*N*-ethylglycine) [Beil. IV-349, IV<sub>2</sub>-(787)], m.p. 180-182° dec. (499), 181.5° dec. (500). — The homologous *N*-alkylglycines appear never to have been prepared from similar reaction of  $\bar{C}$  with alkylamines, but for prepn. of *N*-(*n*-propyl)glycine [Beil. IV-352], m.p. 196-198° dec. (499), *N*-(isopropyl)glycine [Beil. IV<sub>2</sub>-(787)], *N*-(*n*-butyl)glycine, m.p. 192° (501), *N*-(isobutyl)glycine, m.p. 188° (501), or *N*-(*n*-amyl)glycine, m.p. 201° (501), by other methods see indic. refs.]

With secondary aliphatic amines. [ $\bar{C}$  with aq. Me<sub>2</sub>NH (502) (20) for 4 hrs. at 55° under press. (503) or with aq. *N*-aminoacetic acid (*N,N*-dihydro sec (505)). —  $\bar{C}$  with Et<sub>2</sub>NH similarly gives (506) *N,N*-diethylglycine [Beil. IV-350, IV<sub>1</sub>-(472).]

With tertiary aliphatic amines. [ $\bar{C}$  with Me<sub>3</sub>N (507) or  $\bar{C}$  (as Na $\bar{A}$ ) with Me<sub>3</sub>N (508) gives betaine hydrochloride (CH<sub>3</sub>)<sub>3</sub>N(Cl).CH<sub>2</sub>COOH [Beil. IV-347, IV<sub>1</sub>-(470), IV<sub>2</sub>-(786).]

With primary aromatic amines. (See also below under @'s.) [ $\bar{C}$  with aniline in a little ether boiled with a large volume of aq. (509), cf. (511), or  $\bar{C}$  with aniline (3 moles) boiled with aq. and subsequently made alkaline (510), or best  $\bar{C}$  with aq. aniline heated in pressure

of an acid acceptor such as aq. NaOH (512), aq. NaOAc (573) cf. (514), or other alkali or alkaline-earth hydroxides or carbonates (515) (516) (517) (518) (519) gives (yields: 100% (514), 90% (510), 86% (512)) phenylaminoacetic acid (*N*-phenylglycine) [Beil. XII-468, XII-(263)], m.p. 127° (note that if htd. at 200°, however, bimolecular condensation occurs with elimination of 2H<sub>2</sub>O and forma. (520) (521) of *N,N'*-diphenyl-2,5-diketopiperazine, m.p. 263° (520) (521) while distn. causes loss of CO<sub>2</sub> giving (522) *N*-methylaniline). — Note also that reaction of  $\bar{C}$  with 2 moles aniline (523), or further reaction of  $\bar{C}$  with *N*-phenylglycine (above) in aq. alk. (524) (525) (514) (526), gives (yields: 80–85% (526), 50–60% (525)) phenylimino-diacetic acid, C<sub>6</sub>H<sub>5</sub>N(CH<sub>2</sub>COOH)<sub>2</sub> [Beil. XII-480, XII-(265)], m.p. 152–155° dec. (526). — Note also that reaction of  $\bar{C}$  with aniline in pres. of NaOAc gives (525) much *N*-phenylglycine anilide, C<sub>6</sub>H<sub>5</sub>NIICH<sub>2</sub>CONH.C<sub>6</sub>H<sub>5</sub> [Beil. XII-556], m.p. 112°]

[Note that  $\bar{C}$  with many other primary aromatic amines reacts in analogous fashion, but details cannot be included here because of lack of space]

With primary aromatic diamines. [ $\bar{C}$  with *o*-phenylenediamine in dry ether forms (327) a 1:1 cpd presumably to be regarded as salt — However,  $\bar{C}$  (1 mole) with *o*-phenylenediamine (1 mole) in 4 *N* HCl refluxed (528) for 45 min and allowed to stand overnight (529) (530) gives (yields: 80–85% (529), 78–86% (530)) 2-(chloromethyl)benzimidazole, ndls. from EtOH/AcOEt (528), pr. from dioxane (529) or dry acetone (530), m.p. 165° (529), 160–161° (528), 159–160° cor (530), note that value is sensitive to rate of htg. (529) (530). — For studies of behavior of this product with many amines (529) (530), with aq. (530), KI in acetone (530) (531) see indic. refs. — For general study of ortho condensations leading to benzimidazole formn see (532)]

With hydrazines. [ $\bar{C}$  (1 mole) with phenylhydrazine (2 moles) in boilg. aq. alc. K<sub>2</sub>CO<sub>3</sub> ( $\frac{1}{2}$  mole) gives (533) (534) a mixt. of both ( $\alpha$ -phenylhydrazine)acetic acid, C<sub>6</sub>H<sub>5</sub>N(NH<sub>2</sub>).CH<sub>2</sub>COOH [Beil. XV-316], tbs. from abs. EtOH, m.p. 168° (533), 167° dec. (535), and ( $\beta$ -phenylhydrazine)acetic acid, C<sub>6</sub>H<sub>5</sub>NH.NHCH<sub>2</sub>COOH [Beil. XV-321], lfts. from alc., m.p. 153° (536), 152–153° (537); for separation of these isomers see (533).]

[For behavior of  $\bar{C}$  with *N,N*-diphenylhydrazine in aq. Na<sub>2</sub>CO<sub>3</sub> or NaOAc see (538).]

With aromatic primary amines also containing other functional groups. With amino-phenols. [ $\bar{C}$  with *p*-aminophenol on htg. in aq. soln. (539) (540) (541) (542) contg. also NaOAc (543) (544) gives (yields: 45% (544), 35% (539) *N*-(*p*-hydroxyphenyl)glycine [Beil. XIII-488, XIII-(171)] (this product has considerable interest as a photographic developer); for its purification see (540) (545); for pat. on its decomn. at 160–170° in ketone solvents as method of prepn. of *N*-methyl-*p*-aminophenol [Beil. XIII-441, XIII-(149)] see (546). — Note also that in above reaction of  $\bar{C}$  with *p*-aminophenol some *N*-(*p*-hydroxyphenyl)iminodiacetic acid (542) is also formed]

With amino acids. [ $\bar{C}$  with *o*-aminobenzoic (anthranilic) acid in aq. soln. (547) preferably also contg. Na<sub>2</sub>CO<sub>3</sub> (548) (549) (550) gives (yields: 85–89% (550), 70–80% (549)) *N*-(*o*-carboxyphenyl)glycine (phenylglycine-*o*-carboxylic acid) [Beil. XIV-348, XIV-(544)], ndls. from MeOH, m.p. about 215° dec (551); this product upon htg. loses CO<sub>2</sub> giving indoxyl and is therefore an important intermediate in mfg. of indigo; for use of this reaction for detection of  $\bar{C}$  in wine by conversion to indigo see (120) cf. (117) — Note also that in above reaction of  $\bar{C}$  with anthranilic acid some *N*-(*o*-carboxyphenyl)iminodiacetic acid [Beil. XIV-354, XIV-(545)], m.p. 216° dec. (551), is also produced (551); although both phenylglycine-*o*-carboxylic acid (Neut. Eq. 97.5) and *N*-(*o*-carboxyphenyl)iminodiacetic acid (Neut. Eq. 84.3) thus melt at same temp., their mixture melts at about 200° (551).]

With secondary aromatic amines. [ $\bar{C}$  with *N*-methylaniline on htg. (552) or better in aq. NaOH on 4-hr. reflux (553) gives (74% yield (553)) *N*-methyl-*N*-phenylglycine [Beil. XII-473, XII-(264)], oil (B.HCl, m.p. 215–216° dec. (553)). —  $\bar{C}$  with *N*-ethylaniline on

htg. gives (554) *N*-ethyl-*N*-phenylglycine [Beil. XII-475], oil. —  $\bar{C}$  with diphenylamine at 180–200° for 40–50 hrs. gives (5–10% yield (555)) *N,N*-diphenylglycine [Beil. XII- (264).]

With tertiary aromatic amines. [ $\bar{C}$  with dimethylaniline at 100° (556) for 12–18 hrs. (557) gives dimethyl-phenylbetaine hydrochloride [Beil. XII-474], m.p. 194–196° (556), from which silver oxide liberates (557) (558) free dimethyl-phenylbetaine, m.p. 124–126° (557), 123–124° (558). — For corresp. betaine from *N,N*-diethylaniline see (559).]

With tertiary heterocyclic amines. [ $\bar{C}$  with pyridine on htg. (560) (561) (194) cf. (556) at 60° for 5 hrs. (557) gives *N*-(carboxymethyl)pyridinium chloride (pyridohetaine hydrochloride) [Beil. XX-226], m.p. 202–205° dec. (560) (thought by (194) to be typographical error for 102–105° dec.). — For behavior of  $\bar{C}$  with quinoline see (556).]

#### *Behavior of $\bar{C}$ with Amides, Thioamides, etc.*

This topic cannot here be treated in full, but the following cases are reported as examples.

With urea. [ $\bar{C}$  with carhamide (urea) might be expected under appropriate conditions to condense with elimination of HCl and formn. of ureidoacetic acid (hydantoic acid),  $\text{NH}_2\text{CONH}\cdot\text{CH}_2\text{COOH}$  [Beil. IV-359, IV<sub>1</sub>-(477), IV<sub>2</sub>-(792)], m.p. 169–170° (562) (563), 160–161° (564), 160° (565), or its ring-closure product hydantoin [Beil. XXIV-242, XXIV<sub>1</sub>-(287)], m.p. 220°; no report of the chemical behavior of  $\bar{C}$  with urea can be found, however, the two above-mentioned expected products having been prepared by other means. — Note that f.p./compn. data on system  $\bar{C}$  + urea have been recorded (19).]

With thiourea. [ $\bar{C}$  with thiourea (the latter reacting in its isothiurea mode) gives according to conditions either isothiohydantoic acid,  $\text{H}_2\text{N}-\text{C}(=\text{NH})-\text{S}-\text{CH}_2\cdot\text{COOH}$  [Beil. III-251, III<sub>1</sub>-(97)] (566) (567), or pseudothiohydantoin [Beil. XXVII-233, XXVII<sub>1</sub>-(303)], (568) (569) (570) (571) (572) (573).]

With substituted thioureas. The behavior of  $\bar{C}$  with substituted thioureas cannot be treated in full, but the following examples are cited [for reaction of  $\bar{C}$  with various monosubstituted thioureas see (573) (574), with various disubstituted thioureas see (575) (576) (577)].

— Methyl chloroacetate: oil, b.p. 131° (see 3:5585).

— Ethyl chloroacetate: oil, b.p. 144° (see 3:5700).

— Phenyl chloroacetate: m.p. 44–45° (see 3:5565).

— *o*-Tolyl chloroacetate: oil, b.p. 127–127.6° at 10 mm. (578). [From  $\bar{C}$  with *o*-cresol (1:1400) +  $\text{POCl}_3$  in pyridine (574), or from chloroacetyl chloride (3:5235) with *o*-cresol (1:1400) at 130° for 4 hrs. (578); note that this prod. with  $\text{AlCl}_3$  at 140° undergoes Fries rearr. giving (578) both 2-hydroxy-3-methylphenacyl chloride [Beil. VIII<sub>1</sub>-(549)], m.p. 67°, and 4-hydroxy-3-methylphenacyl chloride [Beil. VIII<sub>1</sub>-(550)], m.p. 144–145°.]

— *m*-Tolyl chloroacetate: oil, h.p. 153° at 30 mm. (580). [From chloroacetyl chloride (3:5235) with *m*-cresol (1:1730) (579) (580); note that this prod. with  $\text{AlCl}_3$  at 150° gives (50% yield (580)) 2-hydroxy-4-methylphenacyl chloride [Beil. VIII-113, VIII<sub>1</sub>-(550)], m.p. 101°.]

— *p*-Tolyl chloroacetate: m.p. 32° (580), 29–30° (579); h.p. 162° at 45 mm. (580);  $D_4^{35} = 1.1840$  (41),  $n_D^{35} = 1.5150$  (41). [From  $\bar{C}$  with *p*-cresol (1:1410) +  $\text{POCl}_3$  in pyridine (579), or from chloroacetyl chloride (3:5235) with *p*-cresol (1:1410) at 135° (580); note that this prod. with  $\text{AlCl}_3$  at 140° gives (580) 2-hydroxy-5-methylphenacyl chloride [Beil. VIII-111], m.p. 65° (580).]

— Benzyl chloroacetate: oil, h.p. 147.5° at 9 mm.,  $D_4^4 = 1.2223$ ,  $n_D^{18} = 1.5246$  (581). [From  $\bar{C}$  with benzyl alc. (1:6480) + HCl gas at 100° (581).]

- *p*-Nitrobenzyl chloroacetate: oil, unsuitable as  $\Phi$  (582).
- Phenacyl chloroacetate: unreported.
- *p*-Chlorophenacyl chloroacetate: unreported.
- $\Phi$  *p*-Bromophenacyl chloroacetate: m.p. 103.7° cor. (583).
- *p*-Iodophenacyl chloroacetate: unreported.
- $\Phi$  *p*-Phenylphenacyl chloroacetate: m.p. 116° (581). [From  $\bar{C}$  (as Na $\bar{A}$ ) with *p*-phenylphenacyl bromide (584) (m.p. 121.5–125.5°) in aq. alc. on htg. (581).]
- $\Phi$  *S*-Benzylthiuronium chloroacetate: m.p. 159–160° (585). [Note that for corresp. salts from dichloroacetic acid (3:6205) and trichloroacetic acid (3:1150) m.p. values are respectively 178–179° and 148–149° (585).]
- $\Phi$  *S*-(*p*-Chlorobenzyl)thiuronium chloroacetate: m.p. 158° cor. (586). [From  $\bar{C}$  (as Na $\bar{A}$ ) with *S*-(*p*-chlorobenzyl)thiuronium chloride (586) (m.p. 197°) in alc. (586); note that corresp. deriv. of trichloroacetic acid (3:1150) has m.p. 148° cor.]
- $\Phi$  *S*-(*p*-Bromobenzyl)thiuronium chloroacetate: m.p. 151° cor. (587). [From  $\bar{C}$  (as Na $\bar{A}$ ) with *S*-(*p*-bromobenzyl)thiuronium bromide (587) (m.p. 213°) in alc. (587); note that corresp. deriv. of trichloroacetic acid (3:1150) has m.p. 146° cor. (587).]
- $\Phi$   $\omega$ -Chloroacetamide: m.p. 120.5–121.5° (588), 120° (589), 119–120° (590), 119.5° (591), 118–120° (165), 118° (312), 116.4–116.9° (620). [From methyl chloroacetate (3:5385) (588) (593) or ethyl chloroacetate (3:5700) (590) (589) (592) (591) (595) (596) (597) with cold conc. NH $_4$ OH (78–84% yield (590)), or from chloroacetyl chloride (3:5235) with dry NH $_3$  (597).]
- $\Phi$   $\omega$ -Chloroacetanilide: cryst. from hot aq. or 50% alc., m.p. 138° cor. (598), 136–137° (599), 136° cor. (600), 135° (601), 134–135° (602) (166), 134.5° (603) (604), 131° (605) (606), 133–134° (610). [From  $\bar{C}$  with aniline (606) in presence of P $_2$ O $_5$  (600) (603), from  $\bar{C}$  with aniline salts + PCl $_3$  or SOCl $_2$  (607), from chloroacetyl chloride (3:5235) with aniline (2 moles) in ether (608) (604), C $_6$ H $_6$  (602) (601), or AcOH/NaOAc (599) or with aniline (1 mole) + aq. NaOH in C $_6$ H $_6$  or toluene (609), or from chloroacetic acid anhydride (3:0730) with aniline + P $_2$ O $_5$  (610).] Note that this  $\omega$ -chloroacetanilide with AlCl $_3$  (not more than 1.8 pts (611): at 225° (611) (612) loses HCl with ring closure giving (85% yield (611) (612)) oxindole [Beil. XXI-282, XXI-1-(289)]; also that  $\omega$ -chloroacetanilide with alc. KOH undergoes bimolecular condensation giving (613) *N,N'*-diphenyl-2,5-diketopiperazine, m.p. 261°].
- $\Phi$   $\omega$ -Chloroacet-*o*-toluidide: cryst. from dil. alc., m.p. 111–112° (614) (604), 111° (615). [From  $\bar{C}$  + *o*-toluidine + P $_2$ O $_5$  (615), or from chloroacetyl chloride (3:5235) with *o*-toluidine (2 moles) in dry ether (616) or C $_6$ H $_6$  (611).] [Note that this prod. with AlCl $_3$  at 225° loses HCl with ring closure giving (612) 7-methyloxindole, m.p. 200°, also that with alc. KOH it undergoes bimolecular condensation giving (614) *N,N'*-di-*o*-tolyl-2,5-diketopiperazine.]
- $\Phi$   $\omega$ -Chloroacet-*p*-toluidide: m.p. 161° (615), 162° (608) (617), 161.5° (603). [From  $\bar{C}$  (2 moles) with *p*-toluidine (1 mole) at 80–90° (617) in presence of P $_2$ O $_5$  (615), or from chloroacetyl chloride (3:5235) with *p*-toluidine (2 moles) (608) in ether (613).] [Note that this prod. with AlCl $_3$  at 250° for 2 hrs. loses HCl with ring closure giving (612) 5-methyloxindole [Beil. XXI-291], m.p. 168° (612).]
- $\omega$ -Chloroacet-*N*-benzylamide: cryst. from C $_6$ H $_6$  or lgr., m.p. 91.5–91.5° cor. (618), 90.0–91.6° cor. (619), 92.2–92.8° u.c. (619). [From ethyl chloroacetate (3:5700) with aq. benzylamine on shaking in cold (619) cf. (621), or from chloroacetyl chloride (3:5235) with benzylamine + aq. KOH (618); note, however, that the corresp. derivs. from dichloroacetic acid (3:6208) and from trichloroacetic acid (3:1150) have also at the same m.p.'s, viz., 91.8–91.6° cor. and 91.6–91.4° cor. respectively (619), note also that the simple salt of  $\bar{C}$  with benzylamine has m.p. 119.9–120.9° cor. (591).]

3:1375  $\alpha,\beta$ -DICHLORO-*n*-BUTYRIC  
ACID (low-melting isomer)  
(Crotonic acid dichloride)

 $C_4H_6O_2Cl_2$ 

Beil. II - 279  
II<sub>1</sub>-(124)  
II<sub>2</sub>—

M.P. 63°	(1) (2)	B.P. 132-133° cor. at 27 mm. (5)
	(3) (6)	124.5° at 20 mm. (6)
62.5-63°	(4)	
62°	(8)	124-125° at 20 mm. (1)
61°	(11)	120° at 13 mm. (9)
57-59°	(5)	

[See also  $\alpha,\beta$ -dichloro-*n*-butyric acid (high-melting isomer) (isocrotonic acid dichloride) (3:1903).]

Colorless cryst. from pet. ether, lgr. or dry ether. —  $\bar{C}$  is eas. sol. alc.,  $C_6H_6$ ,  $CHCl_3$ , or  $CS_2$ ; spar. sol. cold lgr.; at 10.5° 3.28 pts.  $\bar{C}$  are sol. in 1 part dry ether. —  $\bar{C}$  deliquesces with a little aq. (5);  $\bar{C}$  with 1 mole  $H_2O$  forms (4) an oil, probably a monohydrate (ortho acid), which in much aq. gives an emulsion gradually separating into two clear layers; note, however, that  $\bar{C}$  has later (11) been claimed to be nonhygroscopic.

[For prepn. of  $\bar{C}$  from crotonic acid (1:0425) with  $Cl_2$  in  $CS_2$  (1) (2) (3) (4) (11) or in  $CCl_4$  +  $CS_2$  (6) in cold see indic. refs.; for formn. of  $\bar{C}$  from isocrotonic acid (1:1045) with  $Cl_2$  in  $CHCl_3$ ,  $CCl_4$ , or  $CS_2$  see (6) (4); for prepn. of  $\bar{C}$  from its corresp. acid chloride (see below) by hydrolysis with aq.  $NaHCO_3$  see (5) (9).]

$\bar{C}$  boils at 212-216° under ord. press. with some loss of  $HCl$  (4).

[ $\bar{C}$  with 6 pts. conc. aq.  $HCl$  (satd. at 0°) in s.t. at 100° for 50 hrs. (1) is partially isomerized to the high-melting stereoisomer (isocrotonic acid dichloride) (3:1903).]

$\bar{C}$  behaves as a fairly strong monobasic acid of ionization const.  $K = 3.2 \times 10^{-3}$  (1);  $\bar{C}$  with dil. aq.  $AgNO_3$  ppts. the spar. sol.  $Ag\bar{A}_2$  (5); no other salts, however, appear to have been reported.

$\bar{C}$  with aq.  $NaOH$  in cold is neutralized without serious decomposition (4); Neut. Eq. = 157 (11); however, if to the resulting soln. further conc. aq.  $NaOH$  is added (4) (7), or if  $\bar{C}$  in alc. is treated with alc.  $KOH$  (6) (2), 1  $HCl$  is split away and the corresp. salt of  $\alpha$ -chloroisocrotonic acid (3:1615) (accompanied by the salt of its isomeric  $\alpha$ -chlorocrotonic acid (3:2760)) is formed.

$\bar{C}$  with aq.  $Na_2CO_3$  at ord. temp. is neutralized without decompn. (4); however,  $\bar{C}$  with excess aq.  $Na_2CO_3$  above 80° also is further attacked giving (4) (25-30% yield (4)) 1-chloropropene-1 (3:7030), accompanied by some propionaldehyde (1:0110),  $\alpha$ -chlorocrotonic acid (3:2760),  $\alpha$ -chloroisocrotonic acid (3:1615), and other products.

$\bar{C}$  in pyridine at 100° for 3 hrs. loses  $HCl$  giving (yield not reported (8))  $\alpha$ -chlorocrotonic acid (3:2760), m.p. 99.5° (8).

[ $\bar{C}$  with  $PCl_5$  or  $SOCl_2$ , although not actually reported, would be expected to yield the corresp. acid chloride; this  $\alpha,\beta$ -dichloro-*n*-butyryl chloride, b.p. 163.3-164.3° cor. at 747 mm. (5), 67.5-71° at 30 mra. (5), has, however, been prepd. indirectly from crotonic acid (1:0425) with  $PCl_5$  (2 moles) at 160° for 2 hrs. (9) or from crotonaldehyde (1:0150) with  $Cl_2$  at 0° in dark (5).]

— Methyl  $\alpha,\beta$ -dichloro-*n*-butyrate: b.p. 174-180° sl. dec. at ord. press. (5), 82.7-85.7° cor. at 28 mm. (5);  $D_4^{18.3} = 1.2614$  (5). [From the above  $\alpha,\beta$ -dichloro-*n*-butyryl chloride with  $MeOH$  (5).]

— Ethyl  $\alpha,\beta$ -dichloro-*n*-butyrate: b.p. 180-200° at 760 mm. (10), 97° at 35 mm. (10), 96° at 35 mm (2). [From  $\bar{C}$  in abs. EtOH with dry HCl (2), or indirectly from butyrylchloral hydrate (3:1905) (1 mole) in EtOH with dry KCN (1 mole) below 15° (10); note, however, that this ester loses HCl with great ease even at ord. temp. giving ethyl  $\alpha$ -chloroacetate (3:8523) and this dehydrohalogenation is greatly accelerated by KCN (10)]

—  $\alpha,\beta$ -Dichloro-*n*-butyramide: unreported. [Note that the amide from the higher-melting stereoisomer of  $\bar{C}$  (3:1003) has m.p. 121°.]

59.5-60° (13)

58° (14)

[See also *trans*-1,2-dichloro-1,2-diphenylethylene (3:4210).]

Colorless ndls —  $\bar{C}$  is much less sol. in alc. than its higher-melting stereoisomer (3:4210); 100 pts. abs. alc. at 24.4° dis. 10-51 pts.  $\bar{C}$  (14). —  $\bar{C}$  like its isomer is very sol. in ether.

Note that  $\bar{C}$  (the lower-melting tolane dichloride) has now been shown (12) to have the *cis* configuration, many earlier reports to the contrary notwithstanding.

Note also that  $\bar{C}$  (2 moles) with (1 mole) diphenylacetylene (tolane) [Beil. V-656, V<sub>1</sub>-(319), V<sub>2</sub>-(568)], m.p. 60°, gives (12) a 2:1 molecular cpd., m.p. 67-69° (12).

$\bar{C}$  on distn. is partially transformed (32% (14)) into its higher-melting *trans* stereoisomer (3:4210) q.v.

Since the methods of prepn. and the chemical behavior of  $\bar{C}$  are the same as those given in detail under its stereoisomer (3:4210) q.v. they are not repeated here.

XII-626, XII<sub>1</sub>-(312)] via diazotization and reaction with  $Cu_2Cl_2$  or Cu (yield 58% (5), 40-50% (9)) (4) see indic. refs.; from chlorobenzene-3,5-disulfonyl chloride with 4 moles  $PCl_5$  in s.t. at 200-210° for 4 hrs. (60% yield (6)) or similarly from bromobenzene-3,5-disulfonyl chloride (7) see indic. refs.]

[For formn. of  $\bar{C}$  from 2,4,6-trichloroiodobenzene with alc. NaOEt see (19); from 1,3,5-trinitrobenzene with conc. HCl in s.t. at 260° see (20); from 2,4,6-trichloroacetophenone on fusion with KOH (10) or from 2,4,6-trichlorobenzaldehyde on warming with 50% NaOH or KOH (3) see indic. refs.; from chloroacetylene (3:7000) by polymerization in light see (21), for formn. of  $\bar{C}$  from  $C_6H_6$  or chlorobenzene (3:7903) with  $Cl_2$  at 400-700° (22), or from mixt. of *m*- and *p*-dichlorobenzenes with  $Cl_2 + AlCl_3$  (23) cf. (24), or from hexachlorobenzene (3:4939) by cat. hydrogenation (25) see indic. refs.; from  $\alpha$ -benzene-hexachloride (3:4410) with alc. KOH, pyridine, or quinoline (9) from  $\beta$ - or  $\gamma$ -benzene-hexachlorides with alc. KOH see (9) cf. (26)]

[ $\bar{C}$  with  $Cl_2$  in pres. of Al/Hg yields (27) 1,2,3,5-tetrachlorobenzene (3:0915); for behavior of  $\bar{C}$  with liq.  $Cl_2$  yielding addn. products see (28)]

[ $\bar{C}$  with MeOH/NaOMe in s.t. at 180° yields mainly (29) 3,5-dichloroanisole, m.p. 39° (29), accompanied by some 3,5-dichlorophenol (3:1670).]

[ $\bar{C}$  on hydrolysis with steam at 550-800° over cat yields (30) phloroglucinol (1:1620); for behavior of  $\bar{C}$  with  $P_2$  see (31); for behavior of  $\bar{C}$  with  $NH_3$  at 700-800° see (32).]

$\bar{C}$  on mononitration, e.g., by warming  $\bar{C}$  (1 g) with 5 ml fuming  $HNO_3$  ( $D = 1.49$ ) at 100° for 15 min., then pouring onto ice (38), gives (2) (8) (100% yield (38)) 1,3,5-trichloro-2-nitrobenzene [Beil. V-247], ndis. from alc., m.p. 69° (8), 67-68° (38). —  $\bar{C}$  on dinitration, e.g., by refluxing for 1 hr. a soln. of  $\bar{C}$  (1 g.) in 5 ml. fuming  $HNO_3$  ( $D = 1.49$ ) + 5 ml. conc.  $H_2SO_4$  (38), gives (yield: 100% (38) (34), 82% (35), 80% (15)) (14) (33) 1,3,5-trichloro-2,4-dinitrobenzene [Beil. V-265], m.p. 131-131.5° (35) (36), 129-130° (34), 128.5° (14) (15) (3), 128.5° (38) (this prod. on htg. with 5 pts. aniline yields (38) 1,3,5-trianilino-2,4-dinitrobenzene, m.p. 179-180° (38)). —  $\bar{C}$  on trinitration, e.g., by boilg. 2 days with mixt. of

fumg.  $\text{HNO}_3$  and fumg.  $\text{H}_2\text{SO}_4$  as directed (37) (39), yields (37) (33) (17) 1,3,5-trichloro-2,4,6-trinitrobenzene [Beil. V-275], m.p.  $187^\circ$  (33),  $193^\circ$  (15),  $192-193^\circ$  (39).

$\bar{\text{C}}$  with conc.  $\text{H}_2\text{SO}_4$  is unchanged even after htg. 56 hrs. at  $100^\circ$  and is only partially sulfonated on htg. 6 hrs. at  $100^\circ$  with fumg.  $\text{H}_2\text{SO}_4$  (12%  $\text{SO}_3$ ) (16); however,  $\bar{\text{C}}$  with 3 pts. fumg.  $\text{H}_2\text{SO}_4$  ( $\text{SO}_3 = 72\%$ ) htd. at  $100^\circ$  for 15 hrs. completely sulfonates yielding (16) 1,3,5-trichlorobenzene-2,4-disulfonic acid (corresp. disulfonyl chloride, m.p.  $161.5^\circ$  (16), corresp. disulfonamide, m.p.  $248^\circ$  (16)).

$\bar{\text{C}}$  with chlorosulfonic acid in  $\text{CHCl}_3$  (38) gives 1,3,5-trichlorobenzenesulfonyl chloride, m.p.  $35-40^\circ$  u.c. (38); this prod. with  $(\text{NH}_4)_2\text{CO}_3$  readily yields (38) 1,3,5-trichlorobenzene-sulfonamide, m.p.  $210-212^\circ$  u.c. dec. (38).

3:1420 1,1,1-TRICHLORO-2,2-  
DIPHENYLETHANE

$\text{C}_{14}\text{H}_{11}\text{Cl}_3$

Beil. V - 606

V<sub>1</sub>-(285)

V<sub>2</sub>-(510)

M.P.  $64^\circ$  (1) (2) (3)

$63-64^\circ$  (5)

Colorless lfts. from alc. — 100 pts. 90-92% alc. dis. at room temp. 5.40 pts.  $\bar{\text{C}}$ ; in hot 37.28 pts.  $\bar{\text{C}}$  (4).

[For prepn. of  $\bar{\text{C}}$  from chloral (3:5210) with  $\text{C}_6\text{H}_6$  (2 moles) + conc.  $\text{H}_2\text{SO}_4$  (almost quant. yield) see (3); from chloral hydrate (3:1270) with  $\text{C}_6\text{H}_6$  + a little  $\text{AlCl}_3$  at  $0^\circ$  see (5) cf. (2); note that both types of this same condensation take place through intermediate formn. of trichloromethyl-phenyl-carbinol [Beil. VI-476, VI<sub>1</sub>-(237)], m.p.  $37^\circ$ , b.p.  $145^\circ$  at 15 mm. (1) (corresp. acetate, m.p.  $87.5^\circ$  (1)) as formerly suspected (6) and subsequently confirmed (1).]

$\bar{\text{C}}$  on reduction gives various products according to conditions [e.g.,  $\bar{\text{C}}$  with  $\text{Na/Hg}$  in

alc. is claimed (7) to give 1,1-diphenylethane [Beil. V-605,  $V_1$ -(285),  $V_2$ -(509)], but this prod. was not obtd. in pure form and was accompanied by 1,1-dichloro-2,2-diphenylethylene (3:1938) (from  $\bar{C}$  by loss of HCl under alk. conditions)].

[ $\bar{C}$  in boilg. 95% alc. contg. trace of  $CuCl_2$  with finely powdered Al/Cu/Zn (Devarda) alloy or Cu/Mg (Arnd) alloy for 6-10 hrs. gives (13-19% yield (8)) 2,2,3,3-tetrachloro-1,1,4,4-tetraphenylbutane [Beil.  $V_2$ -(676)], ndls from AcOH, m.p. 188-190° (8), accompanied by some 2,3-dichloro-1,1,4,4-tetraphenylbutene-2 (see next paragraph).  $\bar{C}$  with Zn dust + conc. aq.  $NH_4OH$  in alc. soln gives (18) (4) stilbene (1:7250) + 1,1-diphenylethane (above).]

[ $\bar{C}$  on reduction with  $H_2$  in pres. of Pd/ $BaCO_3$  in alc./pyridine soln. gives (54-60% yield (9)) 2,2,3,3-tetrachloro-1,1,4,4-tetraphenylbutane (see preceding paragraph) accompanied by both high-melting (137-138°) and low-melting (108-110°) stereoisomers of 2,3-dichloro-1,1,4,4-tetraphenylbutene-2 [Beil.  $V_2$ -(685)]; using Ni as cat. the same prods. result (9) in lower yield sometimes accompanied also by 1,1-dichloro-2,2-diphenylethylene (3:1938) (from  $\bar{C}$  by loss of HCl)]

[ $\bar{C}$  on reduction by electrolytic means in various types of solution, with various metallic electrodes, and at various temperatures gives (10) (11) numerous products including 1,1-dichloro-2,2-diphenylethane (3:1938), 1-chloro-2,2-diphenylethane [Beil. V-606,  $V_1$ -(285)], 1,1,4,4-tetraphenylbutene-2 [Beil.  $V_1$ -(379),  $V_2$ -(694)], etc.; for details see (10) (11).]

[ $\bar{C}$  with  $Cl_2$  under suitable conditions should give 1,1,1,2-tetrachloro-2,2-diphenylethane [Beil. V-606], m.p. 85°, but this reaction has not actually been reported — However,  $\bar{C}$  with a very large excess (15 pts.) pure liquid  $Br_2$  gives (12) 2-bromo-1,1,1-trichloro-2,2-diphenylethane, m.p. 87.5° (12)]

[No mono- or di-nitration products derived from  $\bar{C}$  have been reported.]

$\bar{C}$  on distillation (13), or on boilg. with alc. KOH (2) (14) (for study of rate see (15)), or during course of other reactions involving alkaline conditions (see above) loses HCl giving 1,1-dichloro-2,2-diphenylethylene (3:1938), m.p. 80° (2).

[ $\bar{C}$  with NaOEt in a.t. at 180° ultimately gives (2) cf. (16) (and presumably through intermediate 1,1-dichloro-2,2-diphenylethylene (3:1938)) diphenylacetic acid (1:0705).]

$\bar{C}$  with Na in  $C_6H_6$  refluxed 10-12 hrs. and then treated with alc. gives (17) cf. (2) *trans*-1,2-diphenylethylene (stilbene) (1:7250), m.p. 124°, *cis*-1,2-diphenylethylene (isostilbene) [Beil. V-633,  $V_1$ -(303),  $V_2$ -(539)], and diphenylacetylene (tolano) [Beil. V-656,  $V_1$ -(319),  $V_2$ -(568)]. —  $\bar{C}$  with Zn dust on dry distn. gives (13) stilbene (1:7250).

[ $\bar{C}$  in  $C_6H_6$  with  $AlCl_3$  gives (10% yield (20)) 1,1,2,2-tetraphenylethane [Beil. V-739,  $V_1$ -(371),  $V_2$ -(673)], m.p. 211°.]

[For use of  $\bar{C}$  as addn. agent to improve lubricating power of mineral oils under high pressures see (19).]

3:1430 1-CHLORO-2,2-bis-  
(*p*-CHLOROPHENYL)ETHYLENE

M.P. 64-65° (1)

Cryst. from lgr. — Note that  $\bar{C}$  may occur as a minor impurity in technical grade "DDT" (3:3298).

[For prepn. of  $\bar{C}$  from "*p,p'*-DDD" (3:3320) by elimination of 1 HCl with alc. KOH (77% yield) see (1).]

$\bar{C}$  on oxidn. with  $CrO_3$  gives (84% yield (1)) 4,4'-dichlorobenzophenone (3:4270).

3:1430 (1) Haller, Bartlett, Drake, Newman, Cristol, et al., *J. Am. Chem. Soc.* **67**, 1600 (1945).

3:1445  $\alpha$ -CHLOROACRYLIC ACID

M.P. 65° u.c. (1) (4)

64-66° (7)

64-65° (2) (3) (6)

Cryst. from pet. ether (2), ndls. from ether (1). — Eas. volatile, subliming even at room temp. (1) (4); volatile with steam.

[For prepn. of  $\bar{C}$  from  $\alpha,\alpha$ -dichloropropionic acid (3:6162) with alc. KOH see (4); from methyl  $\alpha,\beta$ -dichloropropionate (3:9103) with aq.  $Ba(OH)_2$  (62% yield (2)) (1) or alc. KOH (5) see indic. refs.; from  $\alpha$ -chloro- $\beta$ -hydroxypropionic acid ( $\alpha$ -chlorohydroxyacrylic acid) [Beil. III-298] by distn. with  $H_2SO_4$  see (6) (7); from trichloroethylene (3:5170) with formaldehyde or paraformaldehyde +  $H_2SO_4$  as directed see (3).]

$\bar{C}$  on treatment with  $Ag_2O$  dec. yielding (1)  $Ag$  +  $AgCl$ .

$\bar{C}$  with fumg. HCl in s.t. at 100° yields (5) (4)  $\alpha,\beta$ -dichloropropionic acid (3:0855), m.p. 50°.

[The esters of  $\bar{C}$  (usually prepd. from the corresp. alkyl  $\alpha,\beta$ -dichloropropionates by elimination of HCl) have assumed special importance because of their ability to polymerize to useful resins; for methyl  $\alpha$ -chloroacrylate see 3:9096; for ethyl  $\alpha$ -chloroacrylate see 3:9242; for *sec*-butyl  $\alpha$ -chloroacrylate, and its mechanism of polymerization, see (8) (9); for studies on the electrical properties of  $\beta$ -chloroethyl  $\alpha$ -chloroacrylate see (10).]

$\bar{C}$  readily polymerizes in ultra-violet light or in pres. of peroxides (2).

## 3:1475 3,5-DICHLOROBENZALDEHYDE

Beil. S.N. 635

M.P. 65° (1)

B.P. 235-240° at 748 mm. (1)

Colorless ndls. or lfts. from pet. ether or dil. MeOH (1). — Spar. sol. hot aq. but eas. volatile with steam — Eas. sol. most organic solvents.

[For prepn. of  $\bar{\text{C}}$  from 3,5-dichlorotoluene (3:6310) via chlorination to 3,5-dichlorobenzal (di)chloride (3:0370) and subsequent hydrolysis with conc.  $\text{H}_2\text{SO}_4$  (70-80% overall yield) see (1) (4).]

$\bar{\text{C}}$  with satd. aq.  $\text{NaHSO}_3$  yields a epd.  $\bar{\text{C}}$   $\text{NaHSO}_3$ ; this is exceptionally sol. in aq., and on hgt. the soln. yields  $\bar{\text{C}}$  (1)

$\bar{\text{C}}$  on oxidn. with excess  $\text{KMnO}_4$  at 100° gives (74% yield (1)) 3,5-dichlorobenzoic acid (3:4840), m p. 188° (1). —  $\bar{\text{C}}$  with 50% aq. KOH for 4 hrs. at 100° gives (90% yield (1)) 3,5-dichlorobenzyl alc., cryst. from  $\text{C}_6\text{H}_6$ , m p. 82° (1), and 3,5-dichlorobenzoic ac. (90% yield (1)) (3:4840).

$\bar{C}$  with  $PCl_5$  gives (80% yield (1)) 3,5-dichlorobenzal (di)chloride (3:0370) cryst. from MeOH or dil. AcOH, m.p. 36.5° (1).

$\bar{C}$  on nitration with fumg.  $HNO_3$  ( $D = 1.48$ ) at 0° as directed (2) gives (99% yield (2)) 3,5-dichloro-2-nitrobenzaldehyde, cryst. from AcOH or lgr., m.p. 91.5° (2), 91° (4). [This deriv. yields an oxime, m.p. 07°, a phenylhydrazone, m.p. 175°, and on oxidn. with  $KMnO_4$  gives 3,5-dichloro-2-nitrobenzoic ac., m.p. 194° cor. (2).]

$\bar{C}$  htd. with  $NaOAc + Ac_2O$  for 18 hrs. at 180-210° gives (76% yield (1)) 3,5-dichlorocinnamic acid, ndls. from  $C_6H_6 +$  pet. eth. or from dū. AcOH, m.p. 176° cor. (1).

[For conversion of  $\bar{C}$  to 3,5-dichlorostyrene (5) (6) in a reaction with MeMgI giving (yields: 69% (5), 55% (3)) 3,5-dichlorophenyl-methyl-carbinol, m.p. 46° (3), b.p. 126° at 4 mm. (5),  $n_D^{20} = 1.5573$  (5), and dehydration of latter with  $KHSO_4$  (43% yield (5)) see indic. refs.]

③ 3,5-Dichlorobenzaldoxime: cryst. from lgr.,  $C_6H_6 +$  pet. eth., or dil. AcOH, m.p. 112° (1).

④ 3,5-Dichlorobenzaldehyde phenylhydrazone: yel. ndls. from pet. eth., m.p. 106.5° (1).

—— 3,5-Dichlorobenzaldehyde *p*-nitrophenylhydrazone: unrecorded.

—— 3,5-Dichlorobenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.

—— 3,5-Dichlorobenzaldehyde semicarbazone: unrecorded.

Acta* 21, 1247 (1938). (5) Marvel, Overberger, Allen, Johnston, Saunders, Young, *J. Am. Chem. Soc.* 68, 864 (1946). (6) Michalek, Clark, *Chem. & Eng. News* 22, 1559-1563 (1944).

### 3:1480 2,3-DICHLOROBENZALDEHYDE

 $C_7H_4OCl_2$ 

Beil. S.N. 635

M.P. 65-67° (1)

Cryst. from 1:1 aq. EtOH.

[For prepn. of  $\bar{C}$  from 2,3-dichlorotoluene (3:6345) by bromination at 180-200° (presumably to 2,3-dichlorobenzal (di)bromide) followed by hydrolysis with conc.  $H_2SO_4$  at 100-140° (71% yield) see (1).]

$\bar{C}$  with MeMgI gives (76% yield (1)) 2,3-dichlorophenyl-methyl-carbinol, m.p. 55-57°, b.p. 112-113° at 2 mm. (corresp. 3,5-dinitrobenzoate, m.p. 145-146° (1)); note that dehydration of the carbinol with  $KHSO_4$  gives (44% yield (1)) 2,3-dichlorostyrene.

—— 2,3-Dichlorobenzaldoxime: unreported.

—— 2,3-Dichlorobenzaldehyde phenylhydrazone: unreported.

—— 2,3-Dichlorobenzaldehyde *p*-nitrophenylhydrazone: unreported.

—— 2,3-Dichlorobenzaldehyde 2,4-dinitrophenylhydrazone: unreported.

—— 2,3-Dichlorobenzaldehyde semicarbazone: unreported.

3:1480 (1) Marvel, Overberger, Allen, Johnston, Saunders, Young, *J. Am. Chem. Soc.* 68, 862 (1946).

## 3:1490 2-CHLORONAPHTHOL-1

 $C_{10}H_7OCl$ 
 Beil. VI - 611  
 VI<sub>1</sub>-(308)  
 VI<sub>2</sub>-(581)

M.P. 65° (1)

64-65° (2)

Ndls. from lgr.; exceptionally easily sol. in alc, ether,  $C_6H_6$ . — More volatile with steam than the isomeric 4-chloronaphthol-1 (3:3720) (use in sepn. (2)).

[For prepn. of  $\bar{C}$  from  $\alpha$ -naphthol (1:1500) with aq. alk.  $NaOCl$  (3) (4) (5) or with  $SO_2Cl_2$  in  $CHCl_3$  soln. (18% yield, together with 42% yield of 4-chloronaphthol-1 (3:3720) (2)), see indic. refs.; from sodium 1-hydroxynaphthalenesulfonate-2 [Beil. XI-269, XI<sub>1</sub>-(63)] with  $PCl_5$  see (6); from 2-chloro-1-hydroxynaphthalenesulfonic acid-4 (1) by hydrolysis in boilg. dil.  $H_2SO_4$  see (1)]

$\bar{C}$  on stdg. in aq.  $Na_2CO_3$  soln. gives blue flocks (7).

$\bar{C}$  with 1 mole  $Br_2$  in 20%  $AcOH$  yields alm. quant. (7) 4-bromo-2-chloro-naphthol-1, ndls., m.p. 112° (7).

[ $\bar{C}$  with conc.  $HI$  ( $D = 1.5$ ) in boilg.  $AcOH$  for 12 hrs. reduces (4) to  $\alpha$ -naphthol (1:1500), but  $\bar{C}$  is unaffected by  $SnCl_2 + HCl$  in alc. even after 28 hrs. 'boilg. (4)]

[ $\bar{C}$  on oxidn. with  $p$ -diamines gives (3) indophenols;  $\bar{C}$  on coupling with diazonium salts gives (3) azo dyestuffs, cf. (1);  $\bar{C}$  with isatin chloride [Beil. XXI-302, XXI<sub>1</sub>-(296)] yields (5) a chloronaphthalene indolindigo]

[ $\bar{C}$  dislvd. in a little alc., made ammoniacal with conc.  $NH_4OH$ , and treated at 5° with nitrosobenzene in alc. gives (84% yield (8)) 2-chloronaphthoquinone-1,4-monoanil-4 (see under 3:3580), very red ndls. from alc., m.p. 112° (8).

# CHAPTER V

## DIVISION A. SOLIDS

(3:1500-3:1999)

3:1505 3,5-DICHLOROBENZOPHENONE  $C_{13}H_5OCl_2$  Beil. S.N. 652  
(3,5-Dichlorophenyl phenyl ketone)

M.P. 65° (1) (2)

Ndls. (from MeOH (1)).

[For prepn. from 3,5-dichloro-4-aminobenzophenone (1) by removal of amino group via diazo reaction see (1); for prepn. from 3,5-dichlorobenzohydrol by oxidn. with  $CrO_3$  (75% yield) see (2).]

$\bar{C}$  fused for 3 hrs. at 200° with a mixt. of KOH + NaOH gives (2) BzOH (1:0715) and a trace of *m*-dichlorobenzene (3:5900).

③ 3,5-Dichlorobenzophenone oxime: from  $\bar{C}$  in alc. on refluxing 8 hrs. with  $NH_2OH \cdot HCl$  + excess NaOH: after distilling off the alcohol, the mixt. of two stereoisomeric oximes is pptd. by pouring into aq.; sepn. of the two isomers can be effected by fractnl. crystn. from dil. MeOH or dil. EtOH (1).

$\alpha$ -form (less-soluble isomer), pl or fine ndls., m.p. 137°. [With  $PCl_5$  in dry ether, followed by water, this form yields quant. 3,5-dichlorobenzanilide, ndls. from dil. alc., m.p. 148° (1).]

$\beta$ -form (more-soluble isomer), constituting 70% of reaction mixt., pr. m.p. 118°. [With  $PCl_5$  in dry ether, followed by water, this form yields a gummy product from which some benz-3,5-dichloroanilide, ndls. m.p. 148.5°, can be sepd. (1).]

3:1505 (1) Waters, *J. Chem. Soc.* 1929, 2108-2109. (2) Lock, Rödiger, *Ber.* 72, 869-870 (1939).

3:1535 4-CHLORO-3-METHYLPHENOL  $C_7H_7OCl$  Beil. VI - 381  
(4-Chloro-*m*-cresol)

M.P. 66° (1) (11) B.P. 235° (1)  
57° (2) 234-236° (11)  
55.5° (3)

Note that  $\bar{C}$  is often designated in the literature as "p-chloro-m-cresol" or even as "6-chloro-m-cresol"; care must be taken to avoid confusion with the isomeric 6-chloro-3-methylphenol (3:0700).

Odorless cryst. (from lgr.). — Volatile with steam (3).

Both the low-melting and high-melting forms appear to be authentic; whether they are different cryst. forms has never been detd.

[For prepn of  $\bar{C}$  from 2-chloro-5-aminotoluene (4-chloro-3-methylaniline) [Beil. XII-871] via diazo reaction see (3); for comml. prepn. from m-cresol (1:1730) by chlorination with  $SO_2Cl_2$  see (1) (4) (84% yield (11)).]

[ $\bar{C}$  on monobromination with  $Br_2$  in AcOH gives (8) 4-chloro-6-bromo-3-methylphenol, m p. 70.0–70.5° (8);  $\bar{C}$  on dibromination yields (9) 4-chloro-2,6-dibromo-3-methylphenol, m p. 68.5–69.5° (9) (for use of latter in bromometric detn. of  $\bar{C}$  see (10)).]

$\bar{C}$  treated with  $(CH_3)_2SO_4$  + aq. NaOH gives its methyl ether, 4-chloro-3-methylanisole, b p. 213.5° (2). [This methyl ether on oxidn with dil.  $KMnO_4$  (6.7 hrs. for 5 g.) gave (2) 2-chloro-5-methoxybenzoic ac [Beil. X-143], ndls. from dil. AcOH (5), m.p. 173.5° (2), 170–171° (5), Neut. Eq. 186.5.

④ 4-Chloro-3-methylphenyl benzoate: from  $\bar{C}$  +  $BzCl$  + pyridine, pl. from alc., m.p. 86° (2) (3). [This benzoate htd with 0.7 of its wt. of  $AlCl_3$  for 10 min. at 140° gives by Fries rearrangement 100% yield (6) of 2-hydroxy-5-chloro-4-methylbenzophenone, yel. ndls. from dil. alc, m p. 142° (6) ]

⑤ 4-Chloro-3-methylphenyl benzenesulfonate: from  $\bar{C}$  + benzenesulfonyl chloride + pyridine, pl. from alc., ro p. 66° (3). [Note that this value is numerically the same as orig  $\bar{C}$  and that the deriv must therefore be distinguished from it, e.g., by mixed m p. or behavior with alk.]

⑥ 4-Chloro-3-methylphenyl p-toluenesulfonate: from  $\bar{C}$  + p-toluenesulfonyl chloride + pyridine, pl from alc (2) (3), ndls from lt. pet (2), m.p. 98° (2) (3). [Note that this deriv does not distinguish  $\bar{C}$  from 6-chloro-3-methylphenol (3:0700) or 2-chloro-3-methylphenol (3:1055).]

⑦ 4-Chloro-3-methylphenyl N- $\alpha$ -naphthylcarbamate: from  $\bar{C}$  +  $\alpha$ -naphthyl isocyanate in presence of trace of trimethyl- or triethyl-amine in ether; cryst from lgr., m.p. 153–154° (7).

3:1535 (1) Kalle and Co., Jan 11, 1897, Ger. 90,847, *Friedländer* 4, 94 (1894/7). (2) Gibson, *J. Chem. Soc.* 1926, 1425–1428. (3) Huston, *Chem. J. Am. Chem. Soc.* 55, 4214–4218 (1933). 3:1550 2,6-DICHLORO-2,6-DIMETHYLHEXANE  
(Di-isocrotyl-bis-hydrochloride)

Beil. I - 163

I<sub>1</sub>—  
I<sub>2</sub>-(127)

M.P. 66–67° (1)  
64° (2) (3)

Colorless lfts. or ndls., sol. in alc, ether,  $CHCl_3$ , or  $C_6H_6$

[For prepn. of  $\bar{C}$  from 2,5-dimethylhexanediol-2,5 [Beil. I-492, I<sub>1</sub>-(256), I<sub>2</sub>-(557)] with

fumg. HCl (1) or AcCl (1) or in AcOH with HCl gas (100% yield (3)) see (1) (3); from the ring-closed internal ether of the above diol, viz., 2,2,5,5-tetramethyltetrahydrofuran [Beil. XVII-17], with fumg. HCl see (2); for prepn. of  $\bar{C}$  from 2,5-dimethylhexadiene-2,4 (di-isocrotyl) [Beil. I-259, I<sub>1</sub>-(122), I<sub>2</sub>-(237)] with HCl in s.t. see (2).]

$\bar{C}$  on htg. boils at 180° with evolution of HCl (1).

[ $\bar{C}$  on slow distn. nt 12-20 mm. over CO<sub>2</sub> saturated soda-lime at 255-270° gives (3) by loss of 2 HCl 2,5-dimethylhexadiene-2,4 (see above), m.p. + 6° (2).]

[For study of behavior of  $\bar{C}$  with aq. alc. N/10 NaOH see (4).]

C<sub>6</sub>H<sub>4</sub>OCl<sub>2</sub>Beil. VI - 190  
VI<sub>1</sub>-(103)  
VI<sub>2</sub>-(179)

M.P. 67° (1) (2) B.P. 219-220° at 740 mm. (2) cf. (3)  
66-68° (8) 80-85° at 4 mm. (2)

Cryst. from pet. eth. with penetrating odor suggesting *o*-chlorophenol or (if dilute) iodoform. — Misc. with alc., ether, volatile with steam.

[For prepn. from *p*-hydroxybenzoic ac (1:0840) by chlorination in AcOH followed by elimin. of CO<sub>2</sub> by htg in quinoline see (4) (5) (8); for prepn. from phenol (1:1420) by prelim. sulfonation, subsequent chlorination in nitrobenzene, and final removal of sulfonic acid group by hydrolysis (70% yield (2)) see (2) ]

$\bar{C}$  is sol. in Na<sub>2</sub>CO<sub>3</sub> soln. (1). [For study of ionization const. see (6).]

$\bar{C}$  on nitration (no details) gives 2,6-dichloro-4-nitrophenol [Beil. VI-241], colorless ndls. from aq., m p. 125° (7)

$\bar{C}$  dislvd. in aq. alk. and shaken with (CH<sub>3</sub>)<sub>2</sub>SO<sub>4</sub> yields (1) (2) the methyl ether, 2,6-dichloroanisole, b.p. 105-106° at 20 mm (2), m p 101° (1).

[For study of rearr. of ethers (8) or esters (9) of  $\bar{C}$  see indic. refs.]

— 2,6-Dichlorophenyl acetate: b p 125-126° at 17 mm.,  $D_{25}^{25} = 1.335$ ,  $n_D^{25} = 1.5281$  (8). [From  $\bar{C}$  with Ac<sub>2</sub>O + pyridine (93% yield (8)).]

⊙ 2,6-Dichlorophenyl benzoate: m p. 74.0-74.5° (9).

— 2,6-Dichlorophenyl *p*-nitrobenzoate: unreported.

— 2,6-Dichlorophenyl 3,5-dinitrobenzoate: unreported.

— 2,6-Dichlorophenyl benzyl ether: m.p. 39.5-40° (10).

— 2,6-Dichlorophenyl *p*-nitrobenzyl ether: unreported.

⊙ 2,6-Dichlorophenoxyacetic acid: ndls from aq., m.p. 134.5-135.0° cor. (9). [From  $\bar{C}$  with chloroacetic acid (3 1370) + aq alk (9) ]

— 2,6-Dichlorophenyl *N*-phenylcarbamate: unreported.

— 2,6-Dichlorophenyl *N*-( $\alpha$ -naphthyl)carbamate: unreported.

— 2,6-Dichlorophenyl *N*-( $\beta$ -naphthyl)carbamate: unreported.

### 3:1610 8-CHLORONAPHTHOL-1

C<sub>10</sub>H<sub>7</sub>OCl

Beil. VI —

VI<sub>1</sub> —

VI<sub>2</sub>-(582)

M.P. 67° (1)

Ndls. from aq — Volatile with steam.

[For formn. of  $\bar{C}$  from 8-chloro-1-nitronaphthalene [Beil. V-556] by merely refluxing with aq. see (1) ]

$\bar{C}$  is sol. in aq alk. giving orange-colored soln. which couples with solns. of diazonium salts (1).

[For reactn. of  $\bar{C}$  with benzotrichloride (3:6540) yielding 4-benzoyl-8-chloronaphthol-1, m.p 121°, used in prepn. of triphenylmethane dyes see (2); with *o*-nitrophenylsulfenyl chloride see (3); for coupling of  $\bar{C}$  with diazotized 2-hydroxynaphthylamine-1 (or its relatives) yielding *o*-hydroxyazo cpds. see (4) ]

3:1610 (1) Woroshtzow, Koslow, *Ber.* 69, 412-415 (1936). (2) Soc. Chem. Ind. Basel, Ger. 378,908, Aug. 7, 1923. Ger. 378,903, Aug. 11, 1923; Swiss 98,559, April 2, 1923; *Cent.* 1923, IV 594. (3) Akt.-Ges. Anilin-Fabrikation, Ger. 402,642; Sept. 17, 1924; *Cent.* 1924, II 2505. (4) Soc. Chem. Ind. Basel, Brit. 150,433, June 22, 1922; *Cent.* 1922, IV 841.

3:1615  $\alpha$ -CHLOROISOCROTONIC ACID  $\text{CH}_3-\text{C}=\text{C}-\text{H}$   $\text{C}_4\text{H}_5\text{O}_2\text{Cl}$  Beil. II - 415  
 $\text{HOOC}-\text{C}=\text{C}-\text{Cl}$  II<sub>1</sub>-(189)  
 (cis-2-Chlorobuten-2-oic acid-1; allo- $\alpha$ -chlorocrotonic acid) II<sub>2</sub>-(306)

M.P. 67.0-67.5° (1)  
 66-67° (2)  
 67° (3)  
 66.2-66.5° (4) (5)  
 66° (6) (7)

[See also  $\alpha$ -chlorocrotonic acid (3:2760).]

Ndls. from aq. (2) (4) (5); note, however, that from aq. solns. of salts acidification first ppts.  $\bar{C}$  as an oil. —  $\bar{C}$  is more sol. aq. than its stereoisomer; e.g.,  $\bar{C}$  is sol. in 15.3 pts. aq. at 19° (8). —  $\bar{C}$  is much more volatile with steam than its stereoisomer (3:2760) (4) (5). —  $\bar{C}$  is spar. sol. cold but eas. sol. hot lgr. (8).

Preparation. [For prepa. of  $\bar{C}$  from lower-melting form (m.p. 63°) of  $\alpha,\beta$ -dichloro-n-butyric acid (3:1375) with excess 10% aq. NaOH at not above 10° see (4) (5) cf. (9).]

Chemical behavior.  $\bar{C}$  on htg. in s.t. at 150-160° for 12 hrs. (10), or with pyridiae hydrochloride in pyridine 7 days at room temp. or rapidly at 100° (2), or even slowly on steam distillation (11) is converted to the stereoisomeric  $\alpha$ -chlorocrotonic acid (3:2760), m.p. 99°.

$\bar{C}$  on reduction with Na/Hg in aq. is dehalogenated yielding (12) (4) crotonic acid (1:0425), m.p. 72°; whether any isocrotonic acid (1:1045), b.p. 169°, m.p. 15°, is formed at all is uncertain.

$\bar{C}$  with  $\text{Cl}_2$  in  $\text{CS}_2$  adds 1 mole halogen yielding (13) the same  $\alpha,\alpha,\beta$ -trichloro-n-butyric acid (3:1280), m.p. 59.5-60°, also obtd. by like treatment of  $\alpha$ -chlorocrotonic acid (3:2760). — The behavior of  $\bar{C}$  with  $\text{Br}_2$  appears to be unreported.

$\bar{C}$  behaves as a monobasic acid; dissociation const. at 25° is  $1.53 \times 10^{-3}$  (14); Neut. Eq. 120.5.

Salts. [ $\text{K}\bar{\text{A}}$ , ndls. from alc. in which it is much more sol. (viz., 1 pt.  $\text{K}\bar{\text{A}}$  in 22 pts. 99.5% alc. at 16.5° (4)) than its stereoisomer (use in sepn. (2) (9)), eas. sol. aq.;  $\text{Ba}\bar{\text{A}}_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$ , eas. sol. aq. but spar. sol. alc. (8);  $\text{Pb}\bar{\text{A}}_2 \cdot \text{H}_2\text{O}$ , ppt. (8).]

[For study of rate of reactn. of  $\bar{C}$  with  $\text{K}_3\text{AsO}_3$  see (3).]

The acid chloride of  $\bar{C}$  is unreported.

— Methyl  $\alpha$ -chloroisocrotonate: unreported. [However, for study of rate of esterification of  $\bar{C}$  with MeOH see (15).]

— Ethyl  $\alpha$ -chloroisocrotonate: oil; see 3:9368. [Note also that  $\bar{C}$  in EtOH with conc.  $\text{H}_2\text{SO}_4$  at 100° gives only (7) the stereoisomeric ethyl  $\alpha$ -chlorocrotonate (3:8523).]

—  $\alpha$ -Chloroisocrotonamide: unreported.

—  $\alpha$ -Chloroisocrotonanilide: unreported.

—  $\alpha$ -Chloroisocroton- $\alpha$ -naphthalide: unreported.

White cryst. from MeOH, EtOH, lgr., or CHCl<sub>3</sub> by addn. of lt. pet. — Note that on distillation under reduced press.  $\bar{C}$  goes over with only slight decompn. as a green vapor which condenses to a green liquid, on solidification much of this color is lost and recrystallization yields colorless  $\bar{C}$ . —  $\bar{C}$  is quite stable in dark; in sunlight, however, it turns brown and decomposes.

PREPARATION OF  $\bar{C}$ 

[For prepn. of  $\bar{C}$  from benzoin (1:5210) with SOCl<sub>2</sub> in pyridine (yield 74-79% (9)) (5) or with SOCl<sub>2</sub> directly (yield 90% (6)) (2) (3) (10) (13) see indic. refs. — Note that *l*-benzoin with SOCl<sub>2</sub> undergoes racemization (7) yielding  $\bar{C}$ .]

[For formn. of  $\bar{C}$  from  $\alpha,\alpha$ -dichlorobenzyl phenyl ketone (*ms,ms*-dichlorodesoxybenzoin) [Beil. VII-436, VII<sub>1</sub>-(234)] by partial dehalogenative reduction using H<sub>2</sub> + platinum oxide cat. (65% yield (1)) or AcOH + Fe powder at 70-80° (15) see indic. refs.; from 1,2-diphenyl-1,2-epoxyethylene (diphenyloxene) with conc. HCl in s.t. at 120° for 2 hrs. see (11); from benzoyl-phenyl-diazomethane (azibenzil) [Beil. VII<sub>1</sub>-(395)] in ether with HCl gas see (12) ]

CHEMICAL BEHAVIOR OF  $\bar{C}$  WITH INORGANIC REAGENTS

Reduction. [ $\bar{C}$  in alc. solu. with H<sub>2</sub> + platinum oxide cat. (1), or in AcOH with Fe powder on protracted treatment (14), gives benzyl phenyl ketone (desoxybenzoin) (1:5165).]

Oxidation. [ $\bar{C}$  with conc. HNO<sub>3</sub> on warming gives (14) dibenzoyl (benzil) (1:9015).]

Halogenation. [ $\bar{C}$  with Br<sub>2</sub> (1 mole) in AcOH at 100° for ½ hr. gives (10)  $\alpha$ -bromo- $\alpha$ -chlorobenzyl phenyl ketone, m.p. 85° ]

Behavior with alkalis and alkali carbonates. (For alc. alkalies see below under organic reactants ) — [ $\bar{C}$  with powdered KOH (3 moles) in toluene refluxed 2 hrs. loses HCl and rearranges giving (20% yield (11)) 1,2-diphenyl-1,2-epoxyethylene (diphenyloxene), b.p. 174-180° at 18 mm., m.p. 52°; note, however, that two later workers (15) (29) have been unable to duplicate this report. — Note, however, that  $\bar{C}$  with powdered KOH in dry ether gives (15) a mixt. of benzoic acid (1:0715), diphenylacetic acid (1:0765), desoxybenzoin (1:5165), and benzil (1:9015).]

[ $\bar{C}$  with excess ignited Na<sub>2</sub>CO<sub>3</sub> at 200° without solvent for 1 hr. gives (11) a mixt. (yield not stated) of both stereoisomeric 1,2-dibenzoyl-1,2-diphenylethylenes (dibenzoylstilbenes): higher-melting isomer [Beil. VII-844], m.p. 232°; lower-melting isomer [Beil. VII-843, VII<sub>1</sub>-(453)], m.p. 212-214° ]

[ $\bar{C}$  with NaSH in alc. soln. in cold gives (16) benzoyl-phenyl-carbinyl mercaptan (desylthiol), m.p. 42–44° (benzoyl ester, m.p. 110–112° (16)), accompanied by two forms of didesyl sulfide, one of m.p. 168–169°, the other of m.p. 128–129° (16).]

Behavior with metals. [ $\bar{C}$  with Na in  $C_6H_6$  evolves  $H_2$  and on warming gives a mixt. which with aq. followed by dil. acid gives (2) a mixt. of benzoic acid (1:0715) + benzoic acid (1:0770) together with an unidentified neutral oil.]

Behavior with other inorganic reactants. [ $\bar{C}$  with moist silver oxide in ethylene glycol at 100° for 3 hrs., then boiled 2 hrs., gives (29) 1,2-dibenzoyl-1,2-diphenylethane (bidesyl) [Beil. VII-841, VII<sub>1</sub>-(452)], m.p. 254–255° (29).]

## CHEMICAL BEHAVIOR OF $\bar{C}$ WITH ORGANIC REACTANTS

Behavior with arom. hydrocarbons +  $AlCl_3$ . [ $\bar{C}$  with  $C_6H_6$  (1:7400) +  $AlCl_3$  gives (78% yield (17)) (18) (19)  $\omega,\omega$ -diphenylacetophenone (*ms*-phenyldeoxybenzoin = triphenylvinyl alc.). [Beil. VII-522, VII<sub>1</sub>-(291)], m.p. 137° (19), 135–136° (17) (18). —  $\bar{C}$  with toluene (1:7405) +  $AlCl_3$  gives (77% yield (17))  $\omega$ -phenyl- $\omega$ -(*p*-tolyl)acetophenone ( $\alpha$ -(*p*-tolyl)-desoxybenzoin), m.p. 97–98° (17). —  $\bar{C}$  with mesitylene (1:7455) +  $AlCl_3$  in  $CS_2$  gives (13)  $\omega$ -phenyl- $\omega$ -mesitylacacetophenone ( $\alpha$ -mesityldeoxybenzoin), m.p. 111–112° (13).] (See also below under reactn. of  $\bar{C}$  with  $RMgX$  cpds.)
